1. Overview

1.1 What is WTU?

OpenVox WTU Wireless Gateway Module allows OpenVox UCP1202/UCP1600/2120/4131, GW1202/1600/2120 chassis to support GSM/LTE connection to the VoIP devices, each module offers 4 GSM/LTE channels.

The WTU wireless gateway modules can bring you excellent HD voice service with multiple codecs, including G.711U, G.711A, GSM, G.722, G.726, G.729, and also flexible SMS service with multiple SMS API. The WTU Wireless Gateway Module is 100% compatible with Asterisk, 3CX, FreePBX, FreeSWITCH and VOS VoIP system platform, providing users with more diverse telecommunications access methods and helping users reduce communication costs.

Figure 1-1-1 WTU-GSM Front Panel

Figure 1-1-2 WTU-LTE Front Panel

1.2 Product Appearance

The picture below are the interfaces and indicator light description of WTU wireless gateway module.

Figure 1-2-1 WTU Front Panel 1

- 1: System Status Indicator (SYS)
- 2: Power Status Indicator(PWR)
- 3: Reset button(RST)
- 4: SIM card slot
- 5: Antenna

1.3 Main Features

- Wide selection of codecs and signaling protocol
- Support SMS sending, receiving, group sending
- Support transferring SMS to E-mail
- Support SMS remotely controlling gateway
- Support USSD service
- Support PIN identification
- Support unlimited routing rules and flexible routing settings
- SIM cards are all hot-swap
- Stable performance, flexible dialing, friendly GUI

1.4 Physical Information

- Size (Without antenna): 124mm*185mm*21mm
- Weight: 164g
- Power: 28W
- SIM Cards: hot-swap
- Operation Temperature: 0~40°C
- Storage Temperature: -20~70°C
- Operation humidity:10% ~ 90% non-condensing

1.5 Software

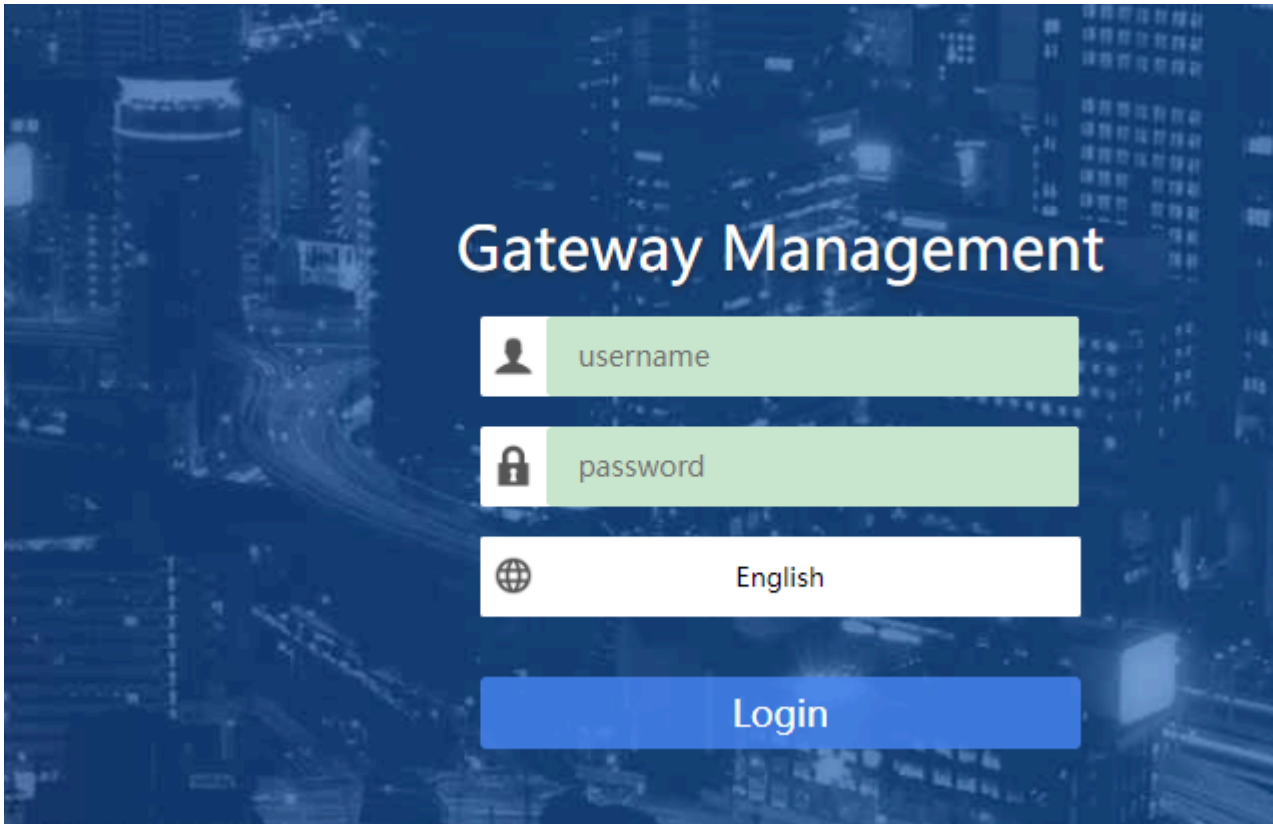

Default IP: 172.16.80.X (X is the slot number of the chassis; If it is slot 3 of UCP1600, the IP address is 172.16.80.3.)

Username: admin

Password: admin

Please enter the default IP in your browser to scan and configure the module you want.

Table 2-1 Description of System Status

Options	Definition
Port	Number of each ports.
Signal	Display the signal strength of in each channels of gateway.
BER	Bit Error Rate.
Carrier	Display the network carrier of current SIM card.
Registration Status	Indicates the registration status of current module.
PDD	Post Dial Delay (PDD) is experienced by the originating customer as the time from the sending of the final dialed digit to the point at which they hear ring tone or other in-band information. Where the originating network is required to play an announcement before completing the call then this definition of PDD excludes the duration of such announcements.

Options	Definition
ACD	The Average Call Duration (ACD) is calculated by taking the sum of billable seconds (bill sec) of answered calls and dividing it by the number of these answered calls.
ASR	Answer Seizure Ratio is a measure of network quality. Its calculated by taking the number of successfully answered calls and dividing by the total number of calls attempted. Since busy signals and other rejections by the called number count as call failures, the ASR value can vary depending on user behavior. ModuleStatus Show the status of port, include blank space and "READY". Black space means it is unavailable here and "Ready" means the port is available
Module Status	Display the status of the port. "Ready" means registering and "READY" means port is available
Remain Time	This value is multiplied by to step length is a rest call time.

2.2 Time

Table 2-2 Description of Time Settings

Options	Definition
System Time	Your gateway system time
Time Zone	The world time zone. Please select the one which is the same or the closest as your city
POSIX TZ String	Posix time zone strings.
NTP Server 1	Time server domain or hostname. For example, [time.asia.apple.com].
NTP Server 2	The first reserved NTP server. For example, [time.windows.com].
NTP Server 3	The second reserved NTP server. For example, [time.nist.gov].
Save Data	Save the Modify of the time settings
Sync from NTP	Sync time from NTP server.
Sync from Client	Sync time from local machine.

For example, you can configure like this:

Figure 2-2 Time Settings

NTP Server 3: ntp1.aliyun.com

Auto-Sync from Server:

Auto-Sync Type: NTP ▾

You can set your gateway time Sync from NTP or Sync from Client by pressing different buttons.

2.3 Login Settings

You can modify "Web Login Settings" and "SSH Login Settings". If you have changed these settings, you don't need to log out, just rewriting your new user name and password will be OK. Also you can specify the web server port number. Normally, the default web login mode is "http and https." For security, you can switch to "only https".

Table 2-3 Description of Login Settings

Options	Definition
User Name	Define your username and password to manage your gateway Allowed characters "-_+. < > & 0-9a-zA-Z". Length: 1-32 characters.
Password	Allowed characters "-_+. < > & 0-9a-zA-Z". Length: 4-32 characters.
Confirm Password	Please input the same password as 'Password' above.
Login Mode	http and https: You can access gateway via link: http://gatewayIP or https://gatewayIP https: You can only access gateway via link: https://gatewayIP
Port	Specify the web server port number.

For example, you can configure like this:

2.4 General

2.4.1 Language Settings

You can choose different languages for your system. If you want to change language, you can switch "Advanced" on, then "Download" your current language package. After that, you can modify the package with the language you need. Then upload your modified packages, "Choose File" and "Add".

For example:

[Language Settings](#) Scheduled Reboot

Language: English ▾ [Download](#) [Delete](#)

Advanced:

2.4.2 Scheduled Reboot

If switch it on, you can manage your gateway to reboot automatically as you like. There are four reboot types for you to choose, "By Day, By Week, By Month and By Running Time".

Figure 2-5 Reboot Type

The screenshot shows the 'WirelessGateway' interface. On the left is a dark blue sidebar with a 'SYSTEM' dropdown menu containing 'Status', 'Time', 'Login Settings', 'General' (highlighted), 'Tools', and 'User'. The main content area is titled 'General' and has two tabs: 'Language Settings' and 'Scheduled Reboot' (active). Below the tabs, there is an 'Enable:' checkbox which is currently unchecked. Underneath, the 'Reboot Type:' is set to 'By Running Time' in a green dropdown menu. Below that, the 'Hour:' is set to '0' in another green dropdown menu.

If use your system frequently, you can set this enable, it can helps system work more efficient.

2.5 Tools and Information

2.5.1 Reboot Tools

You can choose system reboot and asterisk reboot separately.

Figure 2-6 Reboot Tools

The screenshot shows the 'WirelessGateway' interface with the 'Tools' section selected in the sidebar. The main content area has a 'General' tab. There are three rows of tools: 'System Reboot' with a blue button, 'Asterisk Reboot' with a blue button, and 'System Online Update' with a blue button. A confirmation dialog box is overlaid on top, asking 'Are you sure to reboot your gateway now? You will lose all data in memory!' with '确定' (OK) and '取消' (Cancel) buttons.

If you press "OK", your system will reboot and all current calls will be dropped. Asterisk Reboot is the same.

2.5.2 Update Firmware

We offer 2 kinds of update types for you, you can choose System Update or System Online Update. If you choose System Online Update, you will see the following information:

figure 2-7 Update Firmware

New system file is downloaded from official website and update system. Gateway needs to be restarted after firmware upgrade is completed.	<input type="button" value="System Online Update"/>
New system file:	<input type="button" value="选择文件"/> 未选择任何文件 <input type="button" value="System Update"/>

2.5.3 Upload and Backup Configuration

If you want to update your system and remain your previous configuration, you can first backup configuration, then you can upload configuration directly. That will be very convenient for you.

Figure 2-8 Upload and Backup Configuration

New configuration file:	<input type="button" value="选择文件"/> 未选择任何文件 <input type="button" value="File Upload"/>
Config Reset:	<input type="button" value="Config Reset"/>
Current configuration file version: 1.0.2	<input type="button" value="Download Backup"/>

2.5.4 Restore Configuration

Sometimes there is something wrong with your gateway that you don't know how to solve it, mostly you will select factory reset. Then you just need to press a button, your gateway will be reset to the factory status.

Figure 2-9 Restore Configuration

Config Reset:	<input type="button" value="Config Reset"/>
----------------------	---

2.6 Information

On the "Information" page, there shows some basic information about the gateway. You can see software and hardware version, storage usage, memory usage and some help information.

If you want to hide your number when you call out, you can just switch **CLIR** "ON" (Of course you need your operator's support)

Figure 3-4 CLIR Application

CLIR:

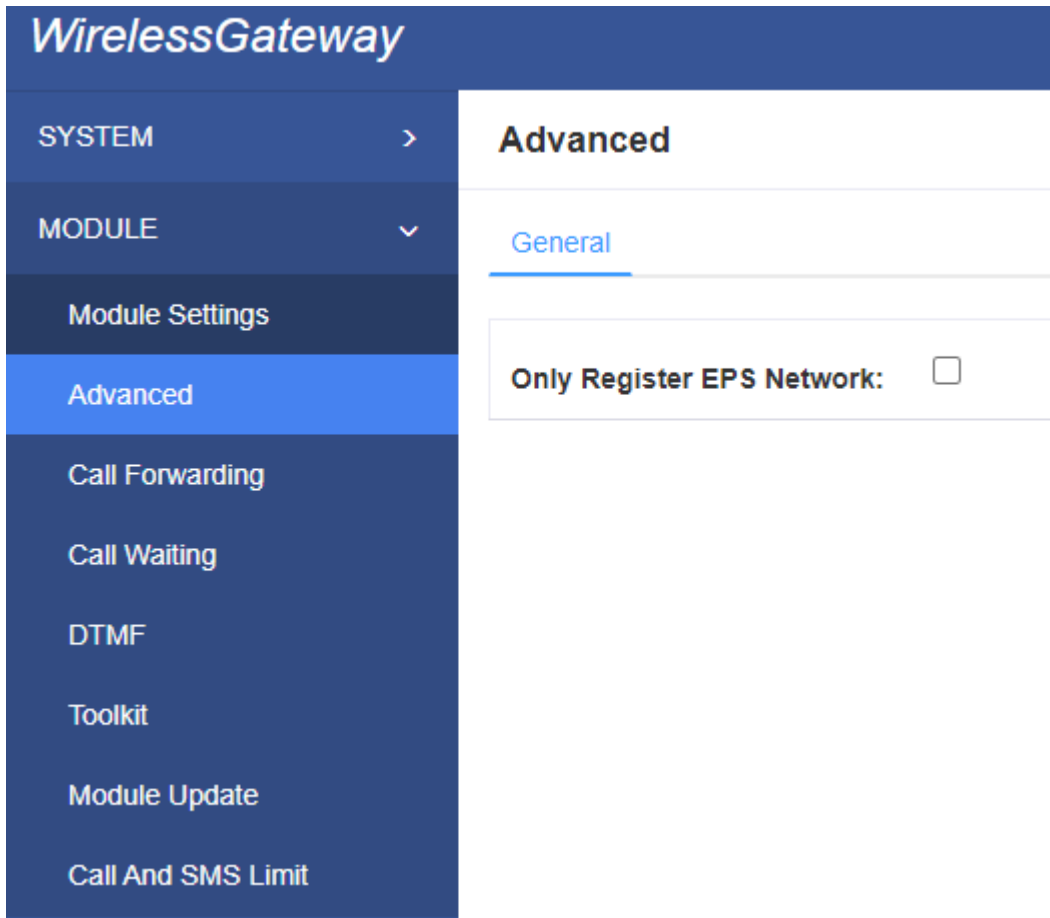

Table 3-1 Definition of Module Settings

Options	Definition
Name	The alias of the each port. Input name without space here. Allowed characters "-_+.<>&0-9a-zA-Z".Length: 1-32 characters.
Speaker Volume	The speaker volume level, the range is 0-100. This will adjust the loud speaker volume level by an AT command.
Microphone Volume	The microphone volume, range is: 0-15. This will change the microphone gain level by an AT command.
Dial Prefix	The prefix number of outgoing calls from this channel
PIN Code	Personal identification numbers of SIM card. PIN code can be modified to prevent SIM card from being stolen.
Custom AT commands when start	User custom AT commands when start system, use “
CLIR	Caller ID restriction, this function is used to hidden caller ID of SIM card number. The gateway will add '#31#' in front of mobile number. This function must support by Operator.
SMS Center Number	Your SMS center number of your local carrier.
Module IMEI	Only CDMA module does not support modifying IMEI

3.2 Advanced

Let device register EPS network. Note: only for 4G or above.

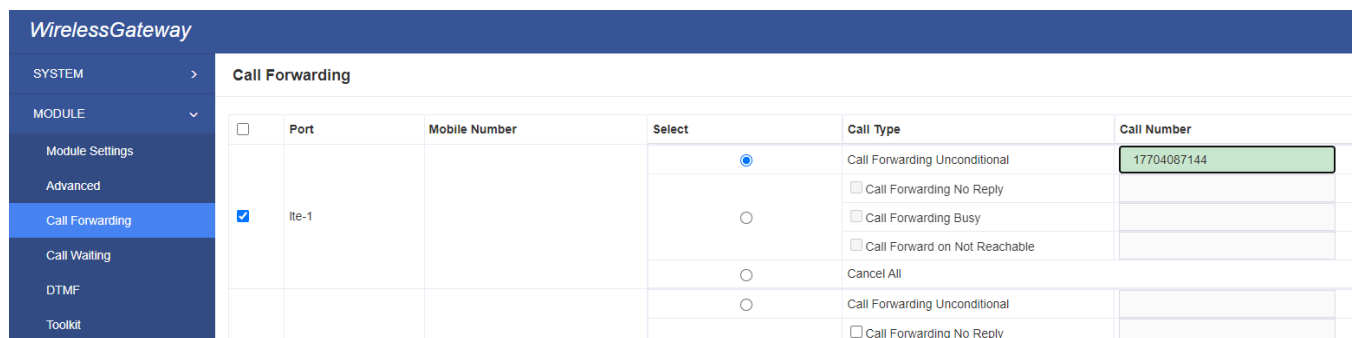

Figure 3-5 Advanced

3.3 Call Forwarding

You can set call forwarding unconditional, no reply, busy and unreachable.

Figure 3-6 Call Forwarding

3.4 Call Waiting

You can open, close or query call waiting here.

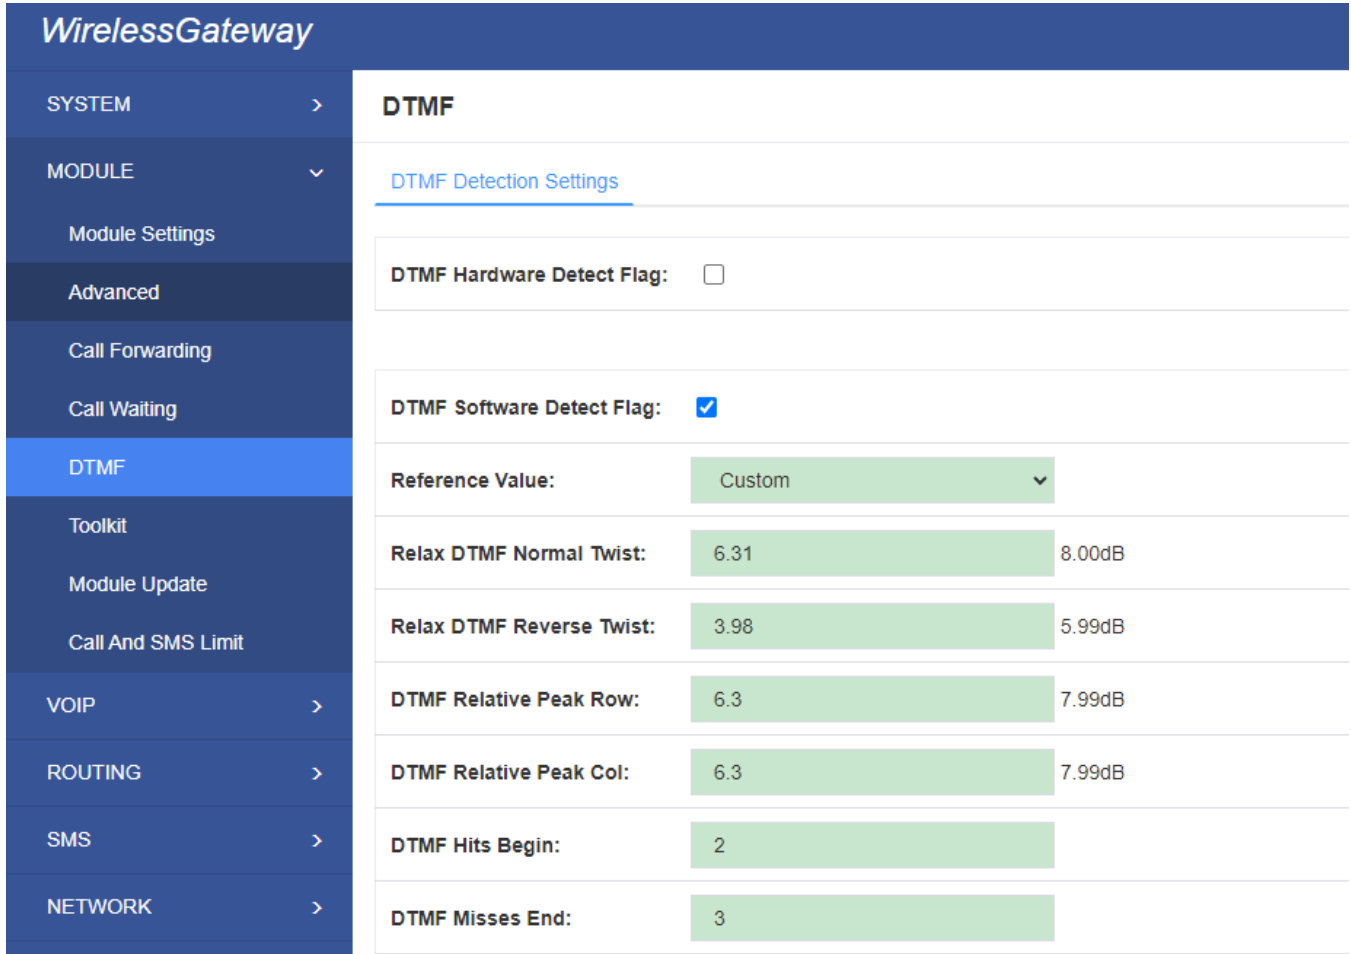

Figure 3-7 Call Waiting

3.5 DTMF

You can do some DTMF Detection Settings if you choose "MODULE → DTMF".

Figure 3-8 DTMF Detection Settings

The screenshot shows the 'DTMF' settings page in the 'WirelessGateway' interface. The sidebar menu includes SYSTEM, MODULE, VOIP, ROUTING, SMS, and NETWORK. The 'DTMF' option is selected. The main content area is titled 'DTMF' and contains the following settings:

- DTMF Hardware Detect Flag:**
- DTMF Software Detect Flag:**
- Reference Value:** Custom
- Relax DTMF Normal Twist:** 6.31 (range 0.02 to 8.00dB)
- Relax DTMF Reverse Twist:** 3.98 (range 0.02 to 5.99dB)
- DTMF Relative Peak Row:** 6.3 (range 0.02 to 7.99dB)
- DTMF Relative Peak Col:** 6.3 (range 0.1 to 7.99dB)
- DTMF Hits Begin:** 2
- DTMF Misses End:** 3

Notice: If you don't have special need, you don't have to modify these settings. You can just choose "Default".

Table 3-2 Description of DTMF Detection Settings

Options	Definition
DTMF Normal Twist and Reverse Twist	It is the difference in power between the row and column energies. Normal Twist is where the Column energy is greater than the Row energy. Reverse Twist is where the Row energy is greater.
DTMF Relative Peak Row	The value is the smaller and the detection is easier. If you lost some numbers, you can try to put the value down. The adjustment range is 0.02 at a time.
DTMF Relative Peak Col	The value is smaller and the detection is easier. If you lost some numbers, you can try to put the value down. The adjustment range is 0.1 at a time.
DTMF Hits Begin	Sampling matching value. You can choose 2 or 3.
DTMF Misses End	The time interval between the two digits you input. Adjust the speed of input. The smaller value represents the shorter intervals.

3.6 Toolkit

You can get USSD information, send AT command and check number with this module. When you have a debug of the module, AT command is useful.

Figure 3-9 Function Options

Toolkit

<input type="checkbox"/>	lte-3		<input type="text"/>	<input type="checkbox"/>
<input type="checkbox"/>	lte-4		<input type="text"/>	<input type="checkbox"/>

Table 3-3 Description of Definition of Functions

Options	Definition
Check Number	Enter a known number (like your mobile phone) to check what number it is of the SIM card. Click "Execute", then the gateway will dial to the number you already input. It only rings for one time and hangs up at once. Not generating telephone charge during this procedure.
Get USSD	Enter a specific USSD number (For example, *142# to check your SIM card's balance. This USSD number is might be different from different carriers) to get the USSD information. The gateway will try to get by AT commands.
AT Command	To perform some specific AT commands. This is useful when you have a debug of the modem. e.g. perform [AT+CSQ] to check what signal qualify it is. In AT commands, there is no difference between "a" and "A"

If you want to send AT command, first you should input your command, then select certain ports and choose "Copy to Selected", finally choose "Execute".

3.8 Call and SMS limit

Figure 3-12 Call And SMS Limit

Call And SMS Limit

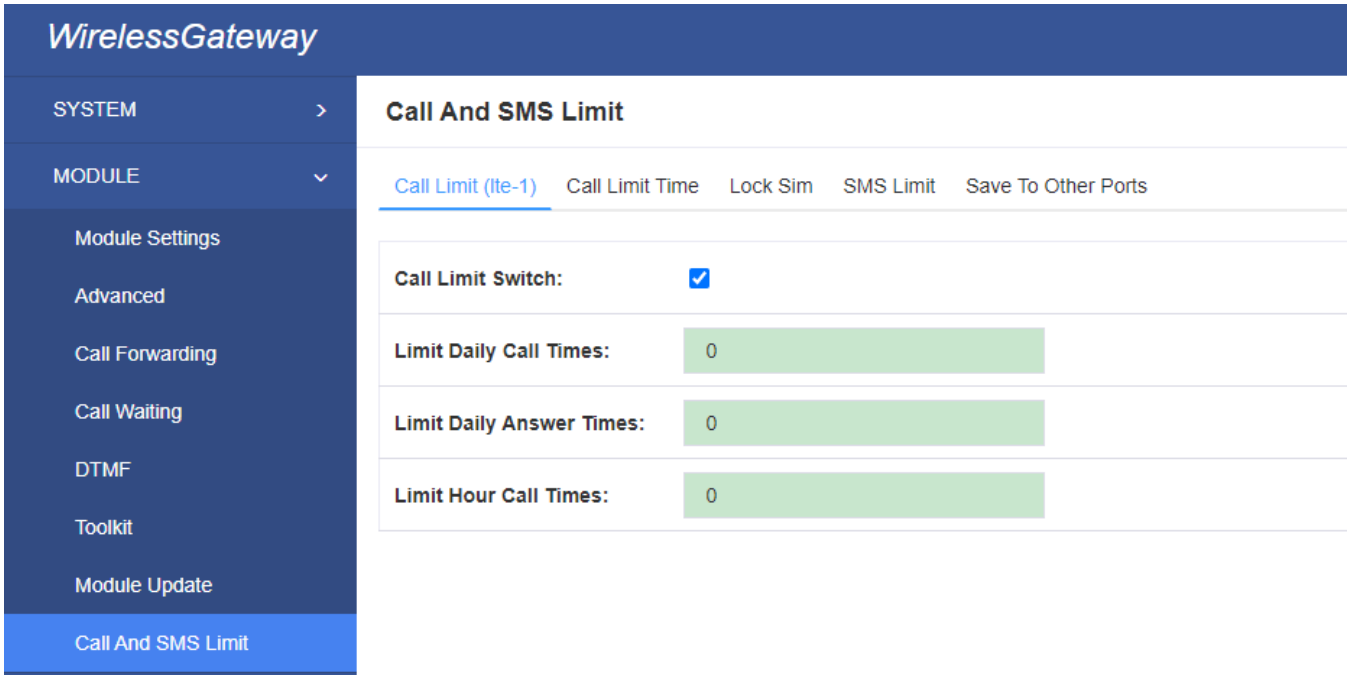

[General](#) [Call Statistics](#) [SMS Sending Statistics](#)

Port	Mobile Number	Type	Call Status	Lock Status	Mark Status	SMS Status	Actions
1		LTE	Unlimited	Unlocked	Unmarked	Unlimited	
2		LTE	Unlimited	Unlocked	Unmarked	Unlimited	
3		LTE	Unlimited	Unlocked	Unmarked	Unlimited	
4		LTE	Unlimited	Unlocked	Unmarked	Unlimited	

We offer you Call Limit, Call Time Limit, Lock Sim, SMS limit.

3.8.1 Call Limit

Figure 3-13 Call Limit

We offer limit number of outbound calls per day, limit number of inbound calls per day and limit number of outbound calls per hour.

3.8.2 Call Limit Time

Now we can offer you two types of call duration limit, you can choose "Single Call Duration Limit" or "Call Duration Limitation" to control your calling time

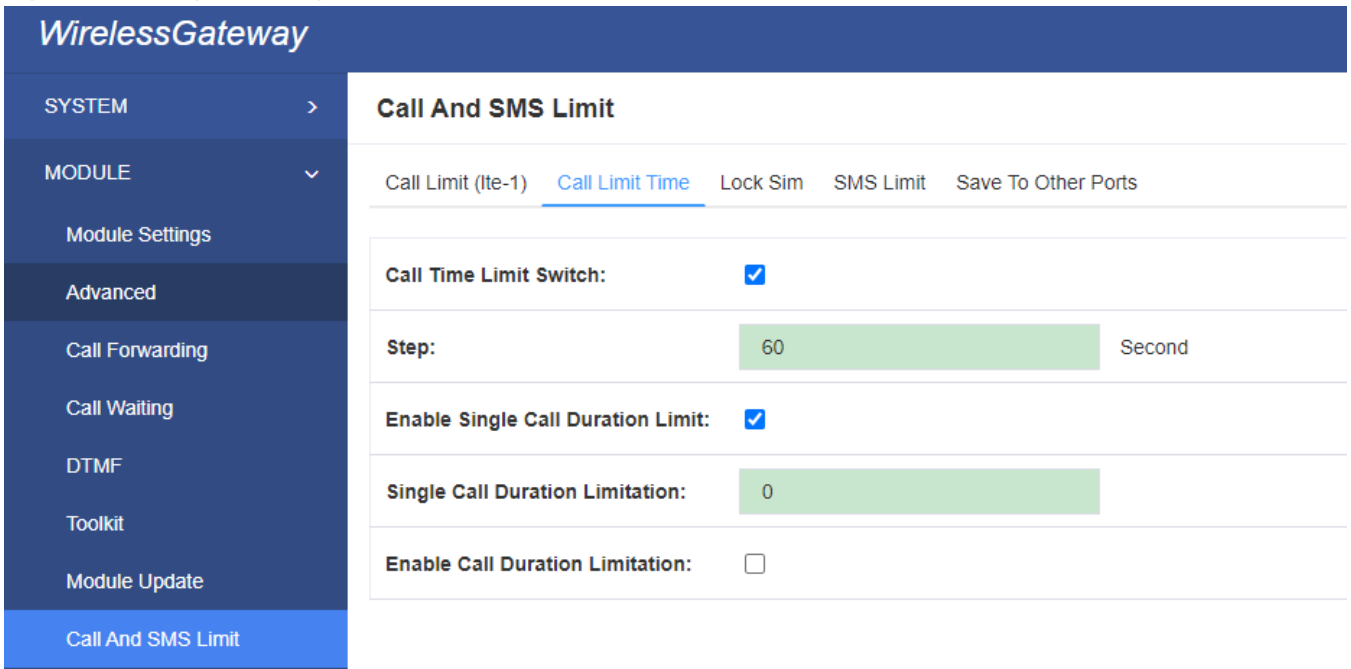

Single Call Duration Limit: This will limit the time of each call.

First you need to switch "Enable" on, then you can set "Step" and "Single Call Duration Limitation" any digits you want. When you make a call by this port, it will limit your calling time within the product of

Step * Single Call Duration Limitation

And if your calling time overtops the value above, the system will hang up this call.

Figure 3-14 Single Settings

Call Duration Limitation: This will limit your total calling time of this port. If remain time is 0, it will not send calls through this port.

Figure 3-15 Call Duration Limitation Settings

The screenshot shows the 'Call And SMS Limit' configuration page in the WirelessGateway interface. The left sidebar contains a navigation menu with categories like SYSTEM, MODULE, VOIP, ROUTING, SMS, NETWORK, ADVANCED, and LOGS. The 'Call And SMS Limit' option is selected under the MODULE category. The main content area is titled 'Call And SMS Limit' and includes several settings:

- Call Limit (lte-1):** Call Limit Time (selected), Lock Sim, SMS Limit, Save To Other Ports
- Call Time Limit Switch:**
- Step:** 60 Second
- Enable Single Call Duration Limit:**
- Enable Call Duration Limitation:**
- Call Duration Limitation:** 20
- Minimum Charging Time:** 10 Second
- Alarm Threshold:** 3
- Alarm Phone Number:** 186000000
- Alarm Description:** (empty field)
- Remain Time:** 20 (with a 'Reset' button)
- Enable Auto Reset:**

The same algorithm with single time limitation, the total calling time of this port can't beyond the product of "Step" and "Call Duration Limitation".

If the duration of a call is less than "Minimum Charging Time", it will be not included in "Call Duration".

You can set a digit for "Alarm Threshold", when the call minutes less than this value, the gateway will send alarm info to designated phone.

You can enable your Auto Reset, then choose by day, by week, or by month.

Figure 3-16 Auto Reset Settings

The screenshot shows the 'Auto Reset Settings' section. It includes the following configuration:

- Enable Auto Reset:**
- Auto Reset Type:** Day(1Day) (dropdown menu)
- Next Reset Time:** 2024-09-10 15:12:23

Table 3-2 Description of Call Duration Limit Settings

Options	Definition
Step	Step length value range is 1-999s, step length multiplied by time of single call just said a single call duration time allowed.
Enable Single Call Duration Limit	Definite maximum call duration for single call. Example: if Time of single call set to 10, the call will be disconnected after talking 10*step seconds.
Enable Call Duration Limitation	This function is to limit the total call duration of channel. The max call duration is between 1 to 999999 minutes.
Minimum Charging Time	A single call over this time, Module side of the operators began to collect fees, unit for seconds.
Alarm Threshold	Define a threshold value of call minutes, while the call minutes less than this value, the gateway will send alarm information to designated phone.
Alarm Description	Alarm port information description, which will be sent to user mobile phone with alarm information.
Alarm Phone Number	Receiving alarm phone number, user will received alarm message from gateway.
Enable Auto Reset	Automatic restore remaining talk time, that is, get total call minutes of each channel.
Auto Reset Type	Reset call minutes by date, by week, by month.
Next Reset Time	Defined next reset date, system will count start from that date and work as Reset Period setting

3.8.3 SMS Limit

You can limit the number of SMS messages sent per day or per month.

4.1.1 Add New SIP Endpoint

Main SIP Endpoint Settings:

You can click  button to add a new SIP endpoint, and if you want to modify existed

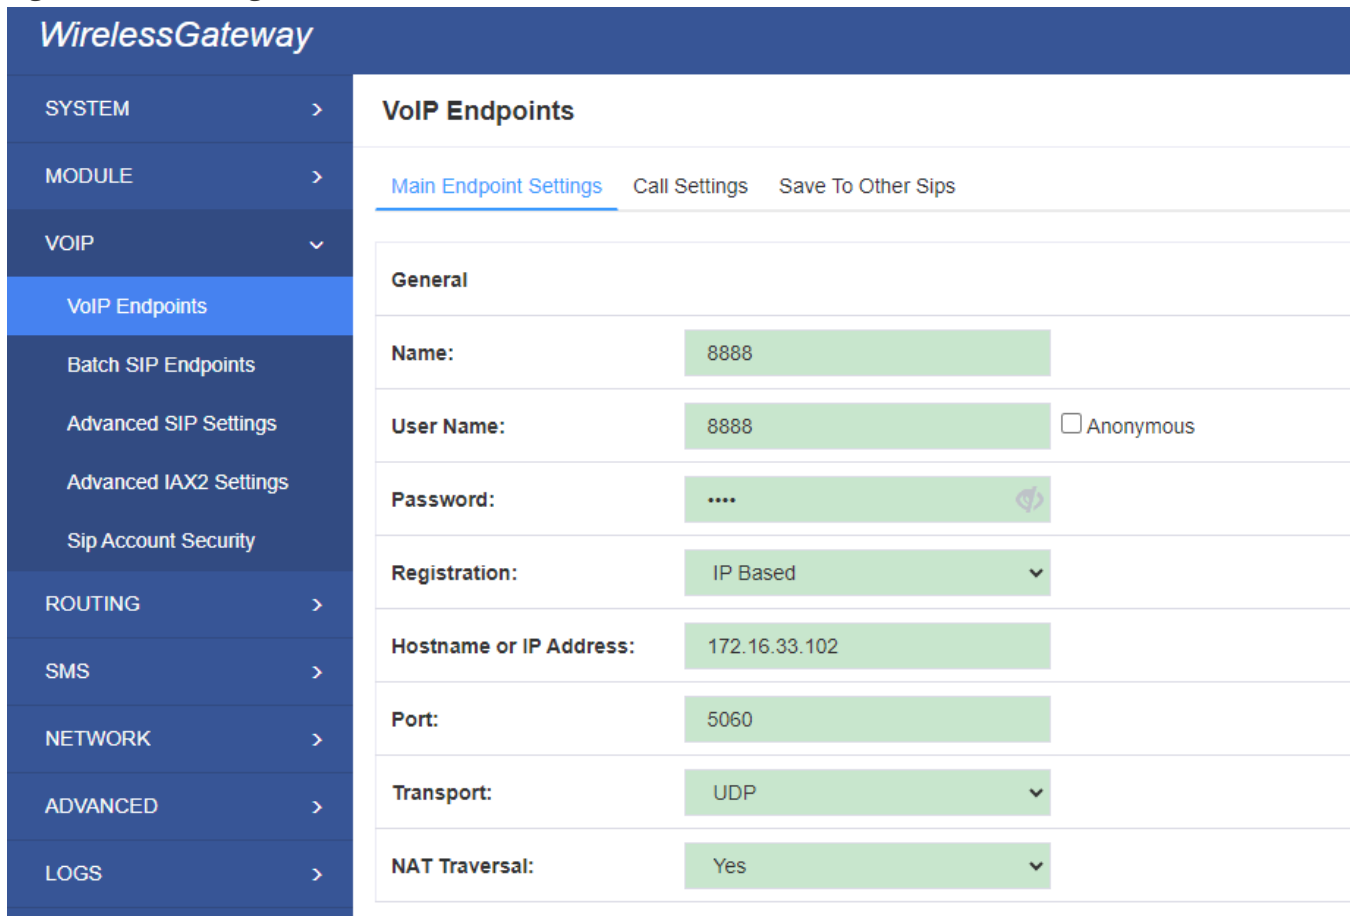

endpoints, you can click  button.

There are 3 kinds of registration types for choose. None, Server or Client.

You can configure as follows:

If you set up a SIP endpoint by registration "None" to a server, then you can't register other SIP endpoints to this server. (If you add other SIP endpoints, this will cause Out-band Routes and Trunks confused.)

Figure 4-2 None Registration

The screenshot shows the configuration interface for a SIP endpoint. The left sidebar contains a navigation menu with categories: SYSTEM, MODULE, VOIP, ROUTING, SMS, NETWORK, ADVANCED, and LOGS. Under the VOIP category, 'VoIP Endpoints' is selected, and its sub-items are: VoIP Endpoints, Batch SIP Endpoints, Advanced SIP Settings, Advanced IAX2 Settings, and Sip Account Security. The main content area is titled 'VoIP Endpoints' and has three tabs: 'Main Endpoint Settings' (active), 'Call Settings', and 'Save To Other Sips'. The 'General' section contains the following fields:

Name:	8888
User Name:	8888 <input type="checkbox"/> Anonymous
Password: 
Registration:	IP Based 
Hostname or IP Address:	172.16.33.102
Port:	5060
Transport:	UDP 
NAT Traversal:	Yes 

For convenience, we have designed a method that you can register your SIP endpoint to your gateway, thus your gateway just work as a server.

General

Name: 2000

User Name: 2000 Anonymous

Password:

Registration: Server ▾

Hostname or IP Address: dynamic

Port: 5060

Transport: UDP ▾

NAT Traversal: Yes ▾

Also you can choose registration by "This gateway registers with the endpoint", it's the same with "None", except name and password.

Figure 4-4 Client

Table 4-1 Definition of SIP Options

Options	Definition
Name	Display name
Username	Register name in your SIP server
Password	Authenticating with the gateway and characters are allowed.
Registration	None --- Not registering; Server --- When register as this type, it means the gateway acts as a SIP server, and SIP endpoints register to the gateway; Client --- When register as this type, it means the gateway acts as a client, and the endpoint should be register to a SIP server;
Hostname or IP Address	IP address or hostname of the endpoint or 'dynamic' if the endpoint has a dynamic IP address. This will require registration.
Transport	This sets the possible transport types for outgoing. Order of usage, when the respective transport protocols are enabled, is UDP, TCP, TLS. The first enabled transport type is only used for outbound messages until a Registration takes place. During the peer Registration, the transport type may change to another supported type if the peer requests so.

NAT Traversal	<p>No --- Use Report if the remote side says to use it. Force Report on --- Force Report to always be on. Yes --- Force Report to always be on and perform comedia RTP handling. Report if requested and comedia --- Use Report if the remote side says to use it and perform comedia RTP handling.</p>

From Domain:	<input type="text" value=""/>
Qualify:	<input type="text" value="No"/> ▾
Qualify Frequency:	<input type="text" value="60"/>
Outbound Proxy:	<input type="text" value=""/> : <input type="text" value=""/>
Custom Registry:	<input type="checkbox"/>
Enable Outboundproxy to Host:	<input type="checkbox"/>

Table 4-2 Definition of Registration Options

Options	Definition
Authentication User	A username to use only for registration.
Register Extension	When Gateway registers as a SIP user agent to a SIP proxy (provider), calls from this provider connect to this local extension.
Register User	Register user name , it is the user of register => user[:secret[:authuser]]@host[:port] [/extension]

Contact User	When the Contact User is 402 Contact: < sip:402@172.16.6.123:5060;transport=UDP
From User	A username to identify the gateway to this endpoint.
From Domain	A domain to identify the gateway to this endpoint.
Qualify	Whether or not to check the endpoint's connection status
Qualify Frequency	How often, in seconds, to check the endpoint's connection status.
Outbound Proxy	A proxy to which the gateway will send all outbound signaling instead of sending signaling directly to endpoints.

Call Settings

Figure 4-6 Call Settings

The screenshot shows the configuration page for a VoIP endpoint in a system named 'WirelessGateway'. The left sidebar contains a navigation menu with categories: SYSTEM, MODULE, VOIP, ROUTING, SMS, and NETWORK. Under the VOIP category, 'VoIP Endpoints' is selected. The main content area is titled 'VoIP Endpoints' and has tabs for 'Main Endpoint Settings', 'Call Settings' (which is active), and 'Save To Other Sips'. Below the tabs, there are two sections: 'DTMF Settings' and 'Caller ID Settings'. In the 'DTMF Settings' section, the 'DTMF Mode' is set to 'RFC2833'. In the 'Caller ID Settings' section, 'Trust Remote-Party-ID' is set to 'No', 'Send Remote-Party-ID' is set to 'No', and 'Caller ID Presentation' is set to 'Allowed,passed screen'.

Table 4-3 Definition of Call Options

Options	Definition
DTMF Mode	Set default DTMF Mode for sending DTMF. Default: rfc2833. Other options: 'info', SIP INFO message (application/dtmf-relay); 'Inband', Inband audio (require 64kbit codec -alaw, ulaw).
Trust Remote-Party-ID	Whether or not the Remote-Party-ID header should be trusted.

Send Remote-Party-ID	Whether or not to send the Remote-Party-ID header.
Caller ID Presentation	Whether or not to display Caller ID.
Call Limit	Usually used when this sip work as a trunk. To limit number of maximum channels supported by the sip trunk.

Advanced:—Signaling Settings

Figure 4-7 Signaling Settings

Advanced: Signaling Settings	
Progress Inband:	Never <input type="button" value="v"/>
Append user=phone to URI:	No <input type="button" value="v"/>
Add Q.850 Reason Headers:	No <input type="button" value="v"/>
Honor SDP Version:	Yes <input type="button" value="v"/>
Directmedia:	Yes <input type="button" value="v"/>
Allow Transfers:	Yes <input type="button" value="v"/>
Allow Promiscuous Redirects:	No <input type="button" value="v"/>
Max Forwards:	70
Send TRYING on REGISTER:	No <input type="button" value="v"/>

Table 4-4 Definition of Signaling Options

Options	Definition
Progress Inband	Whether there is ringing tone. Never: Indicates that incoming calls are never applicable. Optional values: yes / no / never. Default: yes
Append user=phone to URI	Whether or not to Add 'user = phone' to UPIS to include a valid phone number in the URI.

Add Q.850 Reason Headers	If it is available, Whether or not to add a reason header and use it.
Honor SDP Version	Whether or not to display Caller ID.
Allow Transfers	Whether or not to globally enable transfers. Choosing 'no' will disable all transfers (unless enabled in peers or users). Default is enabled.
Allow Promiscuous Redirects	Whether or not to allow 302 or REDIR to non-local SIP address. Note that promiscredir when redirects are made to the local system will cause loops since this gateway is incapable of performing a "hairpin" call.
Max Forwards	Setting for the SIP Max-Forwards header (loop prevention). Send TRYING on REGISTER Send a 100 Trying when the endpoint registers.
Send TRYING on Register	Whether send a 100 Trying when the endpoint registers

Advanced——Timer Settings

Figure 4-8 Timer Settings

Advanced:Timer Settings	
T1 Timer:	500
T2 Timer:	4000
Call Setup Timer:	32000
Session Timers:	Accept ▼
Minimum Session Refresh Interval:	90
Maximum Session Refresh Interval:	1800
Session Refresher:	UAS ▼

Table 4-5 Definition of Timer Options

Options	Definition

Default T1 Timer	This timer is used primarily in INVITE transactions. The default for Timer T1 is 500ms or the measured run-trip time between the gateway and the device if you have qualify=yes for the device.
Default T2 Timer	This timer is used primarily in INVITE transactions. The default for Timer T2 is 4000 ms or the measured run-trip time between the gateway and the device if you have qualify=yes for the device.
Call Setup Timer	If a provisional response is not received in this amount of time, the call will auto-congest. Defaults to 64 times the default T1 timer.
Session Timers	Session-Timers feature operates in the following three modes: originate, Request and run session-timers always; accept, run session-timers only when requested by other UA; refuse, do not run session timers in any case.
Minimum Session	Minimum session refresh interval in seconds. Default is 90secs.
Maximum Session Refresh Interval	Maximum session refresh interval in seconds. Defaults to 1800secs.
Session Refresher	The session refresher, UAC or UAS. Defaults to UAS.

4.1.2 Add New IAX2 Endpoint

You can click  button to add a new IAX2 endpoint, and if you want to modify

existed endpoints, you can click  button.

There are 3 kinds of registration types for choose. You can choose None, Endpoint registers with this gateway(work as a Server) or This gateway registers with the endpoint(work as a Client).

You can configure as follows:

If you set up a IAX2 endpoint by registration "None" to a server, then you can't register other IAX2 endpoints to this server, just authenticate the username and password.

Figure 4-9 None Registrarion

WirelessGateway

SYSTEM > | MODULE > | VOIP > | **VoIP Endpoints** | Batch SIP Endpoints | Advanced SIP Settings | Advanced IAX2 Settings | Sip Account Security | ROUTING > | SMS > | NETWORK > | ADVANCED > | LOGS >

Add New IAX2 Endpoint

[Main Endpoint Settings](#) | [Advanced:Registration Options](#) | [IAX2 Encryption](#) | [IAX2 Trunk settings](#)

Name:	1003
User Name:	1003
Password: <input type="checkbox"/>
Registration:	None ▼
Hostname or IP Address:	172.16.6.20
Auth:	md5 ▼
Transfer:	No ▼
Trunk:	No ▼

For convenience, we have designed a method that you can register your IAX2 endpoint to your gateway, thus your gateway just work as a server.

Figure 4-10 Server

Add New IAX2 Endpoint

[Main Endpoint Settings](#) | [Advanced:Registration Options](#) | [IAX2 Encryption](#) | [IAX2 Trunk settings](#)

Name:	1003
User Name:	1003
Password: <input type="checkbox"/>
Registration:	Server ▼
Hostname or IP Address:	dynamic
Auth:	md5 ▼
Transfer:	No ▼
Trunk:	No ▼

Also you can choose registration by "This gateway registers with the endpoint", it will work as a Client.

Figure 4-11 Client

Table 4-6 Definition of IAX2 Options

Options	Definition
Name	Display name
Username	Authentication name in your IAX2 server
Password	Authenticating with the gateway and characters are allowed.
Registration	None --- Not registering; Endpoint registers with this gateway --- When register as this type, it means the gateway acts as a IAX2 server, and IAX2 endpoints register to the gateway; This gateway registers with the endpoint --- When register as this type, it means the gateway acts as a IAX2 client, and the endpoint should be register to a IAX2 server;
Hostname or IP Address	IP address or hostname of the endpoint or 'dynamic' if the endpoint has a dynamic IP address. This will require registration.

Auth	There are three authentication methods that are supported: md5 , plaintext and rsa . The least secure is "plaintext", which sends passwords clear text across the net. "md5" uses a challenge/response md5 sum arrangement, but still requires both ends have plain text access to the secret. "rsa" allows unidirectional secret knowledge through public/private keys.If "rsa" authentication is used, "inkeys" is a list of acceptable public keys on the local system that can be used to authenticate the remote peer, separated by the ":" character. "outkey" is a single, private key to use to authenticate to the other side.
Transfer	This application allows you to transfer calls.
Trunk	"trunk=yes" Purpose: To obtain a better chart of actual bandwidth usage per codec as seen "on-the-wire" when using IAX2 trunking between two Asterisk telephony servers.

Advanced—Registration Options

Figure 4-12 Registration Options

The screenshot shows the 'WirelessGateway' interface with a sidebar on the left containing menu items like SYSTEM, MODULE, VOIP, and ROUTING. The main content area is titled 'Add New IAX2 Endpoint' and has several tabs: 'Main Endpoint Settings', 'Advanced:Registration Options' (which is active), 'IAX2 Encryption', and 'IAX2 Trunk settings'. Under the active tab, there are several configuration fields:

- Qualify:** A dropdown menu set to 'Yes'.
- Qualify Smoothing:** A dropdown menu set to 'Yes'.
- Qualify Freq Ok:** A text input field containing '6000'.
- Qualify Freq Not Ok:** A text input field containing '6000'.
- Port:** A text input field containing '4569'.
- Require Call Token:** A dropdown menu set to 'Yes'.

Table 4-7 Definition of Registration Options

Options	Definition
Qualify	The qualify settings are used to determine the status availability of an IAX peer. If a peer is considered to be in a reachable (OK or LAGGED) state, it is queried for availability every "qualifyfreqok" milliseconds. If it is considered to be in an UNREACHABLE state, it is queried for availability every "qualifyfreqnotok" milliseconds.The qualify= setting turns the qualify system on (if the "yes" or xxx options are used) or off (if qualify=no, which is by default). The millisecond value of the qualify= setting specifies the maximum response time of the availability acknowledgement before the peer is considered to be in a "LAGGED" state.

Qualify Smothing	Use an average of the last two PONG result to reduce falsely detected LAGGED host. The default is 'no'.
Qualify Freq Ok	How frequently to ping the peer when everything seems to be OK, in milliseconds.
Qualify Freq Not Ok	How frequently to ping the peer when it is either, LAGGED or UNAVAILABLE, in milliseconds.
Port	The port number the gateway will connect to at this endpoint.

IAX2 Encryption

Figure 4-13 IAX2 Encryption

The screenshot shows the 'WirelessGateway' configuration page for 'Add New IAX2 Endpoint'. The left sidebar contains a navigation menu with 'VoIP Endpoints' selected. The main content area has tabs for 'Main Endpoint Settings', 'Advanced:Registration Options', 'IAX2 Encryption' (which is active), and 'IAX2 Trunk settings'. Under the 'IAX2 Encryption' tab, there are two settings: 'Encryption:' and 'Force Encryption:', both set to 'No' via dropdown menus.

Table 4-8 Definition of Encryption Options

Options	Definition
Encryption	Enable IAX2 encryption. The default is no.
Force Encryption	Force encryption insures no connection is established unless both sides support encryption. By turning this option on, encryption is automatically; turned on as well. The default is no

IAX2 Trunk Settings

Figure 5-14 IAX2Trunk Settings

SYSTEM >		Add New IAX2 Endpoint	
MODULE >		Main Endpoint Settings Advanced:Registration Options IAX2 Encryption <u>IAX2 Trunk settings</u>	
VOIP v			
VoIP Endpoints		Trunk Max Size: 128000	
Batch SIP Endpoints		Trunk MTU: 0	
Advanced SIP Settings		Trunk Frequency: 20	
Advanced IAX2 Settings		Trunk Time Stamps: No v	
Sip Account Security		Min. RegExpire: 60	
ROUTING >		Max. RegExpire: 60	
SMS >			

Table 4-9 Definition of Trunk Options

Options	Definition
Trunk Max Size	Defaults to 128000 bytes, which supports up to 800; calls of ulaw at 20ms a frame.
Trunk MTU	With a large amount of traffic on IAX2 trunk, there is a risk of bad voice quality when allowing the Linux system to handle fragmentation of UDP packets. Depending on the side of each payload, allowing the OS to handle fragmentation may not be very efficient. This setting sets the maximum transmission unit for AIX2 UDP trunking. The default is 1240 bytes which means if a trunk's payload is over 1240 bytes for every 20ms it will be broken into multiple 1240 bytes messages. Zero disables this functionality and let's the OS handle fragmentation.
Trunk Frequency	How frequently to send trunk msgs (in ms). This is 20ms by default.
Trunk Time Stamps	Should we send timestamps for the individual sub_frames within trunk frames? There is a small bandwidth use for these (less than 1kbps/call), but they ensure that frame timestamps get sent end-to-end properly. If both ends of all your trunks go directly to TDM, _and_ your trunkfreq equals the frame length for your codecs, you can probably suppress these. The receiver must also need to have it enabled.
Min. RegExpire	Minimum amounts of time that IAX2 peers can request as a registration interval (in seconds).
Max. RegExpire	Maximum amounts of time that IAX2 peers can request as a registration expiration interval(in seconds).

4.2 Batch SIP Endpoints

In this page, you can generate multiple SIP Extensions at the same time.

Figure 4-15 Multiple SIP Extensions Settings

You can fill in the user name, password, domain name or IP address, port, and registration mode on the first line and select the number of SIPs to be created. You can create up to the same number of SIP endpoints as the number of device ports at a time. After the above configuration, click Batch Setup and save it to create SIP endpoints in batches.

Table 4-10 Definition of Multiple SIP Extensions

Options	Definition
Name	Display name
Username	Register name in your SIP server
Password	Authenticating with the gateway and characters are allowed.
Registration	None --- Not registering; Server --- When register as this type, it means the gateway acts as a SIP server, and SIP endpoints register to the gateway; Client --- When register as this type, it means the gateway acts as a client, and the endpoint should be register to a SIP server;
Hostname or IP Address	IP address or hostname of the endpoint or 'dynamic' if the endpoint has a dynamic IP address. This will require registration.
AutoPassword	Tick - Automatically increments based on the password entered in the first line Do not check - All SIP endpoints have the same password as the first one.

UDP Bind Port: 5060

ipv6: No

Enable TCP: No

TCP Bind Port: 5060

TCP Authentication Timeout:

TCP Authentication Limit:

Enable Hostname Lookup: No

Enable Internal SIP Call: No

Internal SIP Call Prefix:

Table 4-11 Definition of Networking General Options

Options	Definition
UDP Bind Port	UDP Bind Port
Enable TCP	Enable server for incoming TCP connection (default is no).
TCP Bind Port	Choose a port on which to listen for TCP traffic.
TCP Authentication Timeout	The maximum number of seconds a client has to authenticate. If the client does not authenticate before this timeout expires, the client will be disconnected.(default value is: 30 seconds).
TCP Authentication Limit	The maximum number of unauthenticated sessions that will be allowed to connect at any given time (default is: 50).
Enable Hostname Lookup	Enable DNS SRV lookups on outbound calls Note: the gateway only uses the first host in SRV records Disabling DNS SRV lookups disables the ability to place SIP calls based on domain names to some other SIP users on the Internet specifying a port in a SIP peer definition or when dialing outbound calls with suppress SRV lookups for that peer or call.

Enable Internal SIP Call	Whether enable the internal SIP calls or not when you select the registration option "Endpoint registers with this gateway".
Internal SIP Call Prefix	Specify a prefix before routing the internal calls.

NAT Settings

Figure 4-17 NAT Settings

The screenshot shows the 'Advanced SIP Settings' page in the 'WirelessGateway' interface. The left sidebar contains a navigation menu with categories: SYSTEM, MODULE, VOIP, ROUTING, SMS, NETWORK, ADVANCED, and LOGS. Under the 'VOIP' category, 'Advanced SIP Settings' is selected. The main content area is titled 'Advanced SIP Settings' and contains the following settings:

- NAT Settings**
- Local Network:** A text input field with an 'Add' button.
- Local Network List:** A table with one column labeled 'IP Range'.
- Subscribe Network Change Event:** A dropdown menu set to 'No'.
- Match External Address Locally:** A dropdown menu set to 'No'.
- Dynamic Exclude Static:** A dropdown menu set to 'No'.
- Externally Mapped TCP Port:** A text input field.
- External Address:** Two text input fields separated by a colon, with an 'Auto Update' checkbox.
- External Hostname:** A text input field.
- Hostname Refresh Interval:** A text input field.

Table 4-12 Definition of NAT Settings Options

Options	Definition
Local Network	Format:192.168.0.0/255.255.0.0 or 172.16.0.0./12. A list of IP address or IP ranges which are located inside a NAT network. This gateway will replace the internal IP address in SIP and SDP messages with the external IP address when a NAT exists between the gateway and other endpoints.
Local Network List	Local IP address list that you added.
Subscribe Network Change Event	Through the use of the test_stun_monitor module, the gateway has the ability to detect when the perceived external network address has changed. When the stun_monitor is installed and configured, chan_sip will renew all outbound registrations when the monitor detects any sort of network change has occurred. By default this option is enabled, but only takes effect once res_stun_monitor is configured. If res_stun_monitor is enabled and you wish to not generate all outbound registrations on a network change, use the option below to disable this feature.

Match External Address Locally	Only substitute the extern addr or extern host setting if it matches.
Dynamic Exclude Static	Disallow all dynamic hosts from registering as any IP address used for statically defined hosts. This helps avoid the configuration error of allowing your users to register at the same address as a SIP provider.
Externally Mapped TCP Port	The externally mapped TCP port, when the gateway is behind a static NAT or PAT.
External Address	The external Address
External Hostname	The external hostname (and optional TCP port) of the NAT.
Hostname Refresh Interval	How often to perform a hostname lookup. This can be useful when your NAT device lets you choose the port mapping, but the IP address is dynamic. Beware, you might suffer from service disruption when the name server resolution fails.

RTP Settings

Figure 4-18 RTP Settings

RTP Settings	
Start of RTP Port Range:	10000
End of RTP port Range:	20000
RTP Timeout:	120

Table 4-13 Definition of RTP Settings Options

Options	Definition
Start of RTP Port Range	Start of range of port numbers to be used for RTP
End of RTP port Range	End of port numbers to be used for RTP
RTP Timeout	RTP Timeout re-transmission time

4.3.2 Parsing and Compatibility

Figure 4-19 Parsing and Compatibility

Table 4-14 Instruction of Parsing and Compatibility

Options	Definition
Strict RFC Interpretation	Check header tags, character conversion in URIs, and multiline headers for strict SIP compatibility(default is yes)
Send Compact Headers	Send compact SIP headers
SDP Owner	Allows you to change the username filed in the SDP owner string. This filed MUST NOT contain spaces.
Ring 183 Mode	Immediately or after ring
Disallowed SIP Methods	The external hostname (and optional TCP port) of the NAT.
Shrink Caller ID	The shrinkcallerid function removes '(', ' ', ')', non-trailing '!', and '-' not in square brackets. For example, the caller id value 555.5555 becomes 5555555 when this option is enabled. Disabling this option results in no modification of the caller id value, which is necessary when the caller id represents something that must be preserved. By default this option is on.
Maximum Registration Expiry	Maximum allowed time of incoming registrations and subscriptions (seconds).
Minimum Registration Expiry	Minimum length of registrations/subscriptions (default 60).

Default Registration Expiry	Default length of incoming/outgoing registration.
Registration Timeout	How often, in seconds, to retry registration calls. Default 20 seconds.
Number of Registration	Attempts Enter '0' for unlimited Number of registration attempts before we give up. 0 = continue forever, hammering the other server until it accepts the registration. Default is 0 tries, continue forever.

4.3.3 Security

Figure 4-20 Security Settings

The screenshot shows the 'WirelessGateway' configuration page. The left sidebar contains a navigation menu with categories: SYSTEM, MODULE, VOIP, ROUTING, SMS, NETWORK, ADVANCED, and LOGS. Under the 'VOIP' category, 'Advanced SIP Settings' is selected. The main content area is titled 'Advanced SIP Settings' and has tabs for 'Networking', 'Parsing and Compatibility', 'Security' (which is active), 'Media', and 'Codec Settings'. Below the tabs, there are two sections: 'Authentication Settings' and 'Guest Calling'. The 'Authentication Settings' section includes: 'Match Auth Username' (No), 'Realm' (empty text field), 'Use Domain as Realm' (No), 'Always Auth Reject' (No), and 'Authenticate Options Requests' (No). The 'Guest Calling' section includes: 'Allow Guest Calling' (Yes).

Table 4-15 Instruction of Security

Options	Definition
Match Auth Username	If available, match user entry using the 'username' field from the authentication line instead of the 'from' field.
Realm	Realm for digest authentication. Realms MUST be globally unique according to RFC 3261. Set this to your host name or domain name.

Use Domain as Realm	Use the domain from the SIP Domains setting as the realm. In this case, the realm will be based on the request 'to' or 'from' header and should match one of the domain. Otherwise, the configured 'realm' value will be used.
Always Auth Reject	When an incoming INVITE or REGISTER is to be rejected, for any reason, always reject with an identical response equivalent to valid username and invalid password/hash instead of letting the requester know whether there was a matching user or peer for their request. This reduces the ability of an attacker to scan for valid SIP usernames. This option is set to 'yes' by default.
Authenticate Options Requests	Enabling this option will authenticate OPTIONS requests just like INVITE requests are. By default this option is disabled.
Allow Guest Calling	Allow or reject guest calls (default is yes, to allow). If your gateway is connected to the Internet and you allow guest calls, you want to check which services you offer everyone out there, by enabling them in the default context.

4.3.4 Media

Figure 4-22 Media Settings

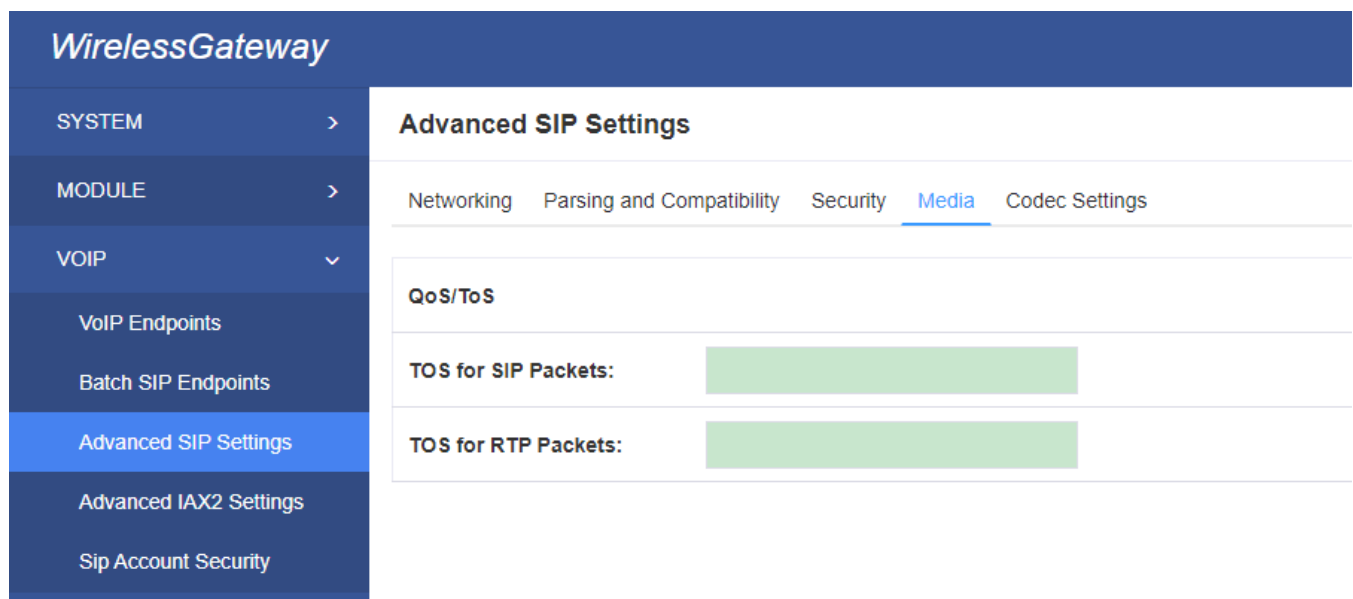

Table 4-16 Instruction of Media

Options	Definition

Premature Media	Some ISDN links send empty media frames before the call is in ringing or progress state. The SIP channel will then send 183 indicating early media which will be empty - thus users get no ring signal. Setting this to "yes" will stop any media before we have call progress (meaning the SIP channel will not send 183 Session Progress for early media). Default is 'yes'. Also make sure that the SIP peer is configured with progressinband=never. In order for 'noanswer' applications to work, you need to run the progress() application in the priority before the app.
TOS for SIP Packets	Sets type of service for SIP packets
TOS for RTP Packets	Sets type of service for RTP packets

4.3.5 Codec Settings

Select codecs from the list below.

Figure 4-22 Codec Settings

The screenshot shows the configuration page for a WirelessGateway. The left sidebar contains a navigation menu with categories: SYSTEM, MODULE, VOIP, ROUTING, SMS, and NETWORK. Under the VOIP category, several sub-items are listed, with 'Advanced SIP Settings' currently selected and highlighted in blue. The main content area is titled 'Advanced SIP Settings' and has several tabs: Networking, Parsing and Compatibility, Security, Media, and Codec Settings (which is active). Below the tabs, there is a list of seven 'Codec Priority' settings. Each setting consists of a label (e.g., 'Codec Priority 1:') and a dropdown menu showing the selected codec (e.g., 'G.711 u-law').

Priority	Selected Codec
Codec Priority 1:	G.711 u-law
Codec Priority 2:	G.711 a-law
Codec Priority 3:	GSM
Codec Priority 4:	G.722
Codec Priority 5:	G.723
Codec Priority 6:	G.726
Codec Priority 7:	G.729

4.4 Advanced IAX2 Settings

4.4.1 General Settings

Figure 4-23 General Settings

Advanced IAX2 Settings

General	Music On Hold	Codec Settings	Jitter Buffer Settings	Misc Settings	Quality of Service
Bind Port:	4569				
Bind Address:	0.0.0.0				
Enable IAX Compat:	No <input type="button" value="v"/>				
Enable No Checksums:	No <input type="button" value="v"/>				
Enable Delay Reject:	No <input type="button" value="v"/>				
ADSI:	No <input type="button" value="v"/>				
SRV lookup:	No <input type="button" value="v"/>				
AMA Flags:	default <input type="button" value="v"/>				
Auto Kill:	Yes <input type="button" value="v"/>				
Lauguage:	English <input type="button" value="v"/>				
Account Code:					
Call Token Optional:					
Description:					

Table 4-17 Instruction of General

Options	Definition
Bind Port	Bind port and bindaddr may be specified
Bind Address	More than once to bind to multiple addresses, but the first will be the default.
Enable IAXCompat	More than once to bind to multiple addresses, but the first will be the default.

Enable No checksums	Set iaxcompat to yes if you plan to use layered switches or some other scenario which may cause some delay when doing a lookup in the dialplan. It incurs a small performance hit to enable it. This option cause Asterisk to spawn a separate thread when it receives an IAX DPREQ (Dialplan Request) instead of blocking while it waits for a response.
Enable Delay Reject	Disable UDP checksums (if no checksums is set, then no checksums will be calculated/checked on system supporting the feature)
ADSI	ADSI (Analog Display Services Interface) can be enable if you have (or may have) ADSI compatible CPE equipment.
SRV Loopup	Whether or not to perform an SRV lookup on outbound calls
AMA Flags	You may specify a global default AMA flag for iaxtel calls. These flags are used in the generation of call detail records.
autokill	If we don't get ACK to our NEW within 2000ms,and autokill is set to yes, then we cancel the whole thing(that's enough time for one retransmission only).This is used to keep things from stalling for a long time for a host that is not available for bad connections.
Language	You may specify a global default language for users. This can be specified also on a per-user basis. If omitted, will fallback to English(en)
Account Code	You may specify a default account for Call Detail Records (CDRs) in addition specifying on a per-user basis.

4.4.2 Music on Hold

Figure 4-24 Music on Hold Settings

Band Width: low ▼

Disallow: all ▼

Allow:

- Priority 1 GSM ▼
- Priority 2 G.711 u-law ▼
- Priority 3 G.711 a-law ▼
- Priority 4 G.722 ▼
- Priority 5 G.723 ▼
- Priority 6 G.729 ▼

Codec Priority: host ▼

Table 4-19 Instruction of Codec Settings

Options	Definition
Band Width	Specify bandwidth of low, medium, or high to control which codes are used in general
Disallow	Fine tune codes here using "allow" and "disallow" clause with specific codes

Allow	Fine tune codes here using "allow" and "disallow" clause with specific codes
Codec Priority	Codec priority controls the codec negotiation of an inbound IAX2 call. This option is inherited to all user entity separately which will override the setting in general.

4.4.4 Jitter Buffer Settings

Figure 4-26 Jitter Buffer

Advanced IAX2 Settings

General Music On Hold Codec Settings **Jitter Buffer Settings** Misc Settings Quality of Service

Jitter Buffer:	No
Force Jitter Buffer:	No
Max Jitter Buffers:	
Resyncthreshold:	
Max Jitter Interps:	
Jitter Target Extra:	

Table 4-20 Instruction of Jitter Buffer

Options	Definition
Jitter Buffer	Global default as to whether you want the jitter buffer at all
Force Jitter Buffer	In the ideal world, when we bridge VoIP channels we don't want to jitter buffering on the switch, since the endpoints can each handle this. However, some endpoints may have poor jitter buffers themselves, so this option will force to always jitter buffer, even in this case.
Max Jitter Buffers	A maximum size for the jitter buffer
Resyncthreshold	When the jitter buffer notice a significant change in delay that continue over a few frames, it will resync, assuming that the change in delay was caused by a timestamping mix-up. The threshold for noticing a change in delay is measured as twice the measured jitter plus this resync threshold.

Max Jitter Interps	The maximum number of interpolation frames the jitter buffer should return in a row. Since some clients do not send CNG/DTX frames to indicate silence, the jitter buffer will assume silence has begun after returning this many interpolations. This prevents interpolating throughout a long silence.
Jitter Target Extra	Number of milliseconds by which the new jitter buffer will pad its size. The default is 40, so without modification, the new jitter buffer will set its size to the jitter value may help if your network normally has low jitter, but occasionally has spikes.

4.4.5 Misc Settings

Figure 4-27 Misc Settings

Advanced IAX2 Settings

General Music On Hold Codec Settings Jitter Buffer Settings Misc Settings Quality of Service

IAX2 Thread Count:	<input type="text"/>
IAX2 Max Thread Count:	<input type="text"/>
Max Call Number:	<input type="text"/>
MaxCallNumbers_Nonvalidated:	<input type="text"/>

Table 4-21 Instruction of Misc Settings

Options	Definition
IAX Thread Count	Establishes the number of iax helper thread to handle I/O
IAX Max Thread Count	Establishes the number of extra dynamic threads that may be spawned to handle I/O
Max Call Number	The 'maxcallnumbers' option limits the amount of call numbers allowed for each individual remote IP address. Once an IP address reaches its call number limit, no more new connections are allowed until the previous ones close. This option can be used in a peer definition as well, but only takes effect for the IP of a dynamic peer after it completes registration.

MaxCallNumbers_Nonvalidated	The 'maxcallnumbers-nonvalidated' is used to set the combined number of call numbers that can be allocated for connections where call token validation has been disabled. Unlike the 'maxcallnumbers' option, this limit is not separate for each individual IP address. Any connection resulting in a non-call token validated call number being allocated contributes to this limit. For use cases, see the call should be sufficient in most cases.

Routing Name: in

Call Comes in From: aa

Send Call Through: 1001

The figure above shows that all the phones in group-aa are transferred to the SIP-1001 terminal.

Table 5-1 Definition of Routing Options

Options	Definition
Routing Name	The name of this route. Should be used to describe what types of calls this route matches (for example, 'SIP2CDMA' or 'CDAM2SIP').
Call Comes in From	The launching point of incoming calls.
Send Call Through	The destination to receive the incoming calls.

Table 5-2 Description of Advanced Routing Rule

Options	Definition
---------	------------

Dial Patterns that will use this Route	A Dial Pattern is a unique set of digits that will select this route and send the call to the designated trunks. If a dialed pattern matches this route, no subsequent routes will be tried. If Time Groups are enabled, subsequent routes will be checked for matches outside of the designated time(s). Rules: X matches any digit from 0-9 Z matches any digit from 1-9 N matches any digit from 2-9 [1237-9] matches any digit in the brackets (example: 1,2,3,7,8,9) . wildcard: matches one or more dialed digits. prepend: Digits to prepend to a successful match If the dialed number matches the patterns specified by the subsequent columns, then this will be prepended before sending to the trunks prefix: Prefix to remove on a successful match The dialed number is compared to this and the subsequent columns for a match. Upon a match, this prefix is removed from the dialed number before sending it to the trunks. match pattern: The dialed number will be compared against the prefix + this match pattern. Upon a match, the match pattern portion of the dialed number will be sent to the trunks CallerID: If CallerID is supplied, the dialed number will only match the prefix + match pattern if the CallerID has been transmitted matches this. When extensions make outbound calls, the CallerID will be their extension number and NOT their Outbound CID. The above special matching sequences can be used for CallerID matching similar to other number matches.
Set the Caller ID Name to	What caller ID name would you like to set before sending this call to the endpoint.
Forward Number	What destination number will you dial? This is very useful when you have a transfer call.
Custom Context	User-defined dialing rules
Failover Call Through Number	The gateway will attempt to send the call out each of these in the order you specify. You can create various time routes and use these time conditions to limit some specific calls.

Figure 5-3 Time Patterns that will use this Route

Time Patterns that will use this Route

Time to start: - : -	Week Day start: -	Month Day start: -	Month start: -
Time to finish: - : -	Week Day finish: -	Month Day finish: -	Month finish: -

+ Add More Time Pattern Fields

If you configure like this, then from January to March, from the first day to the last day of these months, from Monday to Thursday, from 00:00 to 02:00, during this time (meet all above time conditions), all calls will follow this route. And the time will synchronize with your Sever time.

Figure 5-4 Failover Call Through Number

Failover Call Through Number

Failover Call Through Number 1:

Ite-19

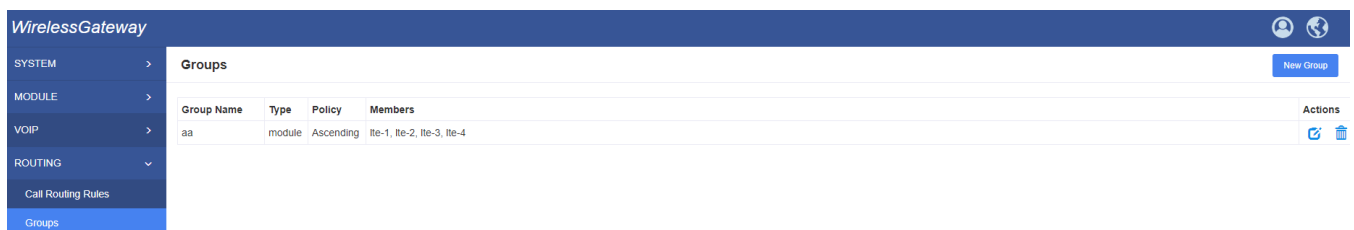

Add a Failover Call Through Provider

You can add one or more "Failover Call Through Numbers".

5.1 Groups

Sometimes you want to make a call through one port, but you don't know if it is available, so you have to check which port is free. That would be troublesome. But with our product, you don't need to worry about it. You can combine many Port or SIP to groups. Then if you want to make a call, it will find available port automatically.

Figure 5-5 Routing Group

Group Name	Type	Policy	Members
aa	module	Ascending	Ite-1, Ite-2, Ite-3, Ite-4

5.2 Batch Creating rules

This page can generate multiple routing rules at the same time.

Figure 5-6 Batch Creating rules Group

Port	Sim Number	Sip Trunk	CallerID
<input type="checkbox"/> Ite-1		None	
<input type="checkbox"/> Ite-2		None	
<input type="checkbox"/> Ite-3		None	
<input type="checkbox"/> Ite-4		None	
<input type="checkbox"/> Ite-6		None	

You can configure the SIM Number, SIP trunk and calling Number for each port. And then, click "save" to batch creating multiple Routing rules. By an attention, the SIP trunk must be configured and the SIM number and calling Number can be empty.

Table 5-3 Description of Advanced Routing Rule

Options	Definition
Sim Number	What destination number will you dial? This is very useful when you have a transfer call.
SIP Trunk	Inbound and outbound calls through designated SIP trunks
CallerID	Make only caller ID to call.

5.3 MNP Settings

Mobile Number Portability allows switching between mobile phone operators without changing the mobile number. Sounds simple, but there are loads of tasks performed behind the scene at the operator end. The URL is shown in the password string way. So please type the url in other place such a txt file, check it, then copy it to the gateway. The outgoing number in the url should be replaced by the variables **`\${num}`**. Here is an example of the MNP url:

<https://s1.bichara.com.br:8181/chkporta.php?user=832700&pwd=sdsfdg&tn=8388166902>

The 8388166902 is the outgoing phone number, when config the MNP url, should replce it with **`\${num}`**. Then it turns to [https://s1.bichara.com.br:8181/chkporta.php?user=832700&pwd=sdsfdg&tn=\\${num}](https://s1.bichara.com.br:8181/chkporta.php?user=832700&pwd=sdsfdg&tn=${num})

SMS Outbox Auto clean: maxsize: 1MB

SMS Reboot Auto Clean All:

For example, SMS control password is 123456 which has nothing to do with the login password, you can send "get info 123456" to the module's phone number to get your gateway's IP information.

Table 6-4 Definition of SMS Control

Options	Definition
Enable	ON(enable), OFF(disable)
Password	The password to confirm that SMS makes the gateway rebooted, shut down, restored configuration files and get info on this gateway.
SMS Format	For example, the message formats: reboot system PASSWORD: To reboot your whole gateway. The PASSWORD is referring to the PASSWORD you set up from option "PASSWORD" above. Reboot asterisk PASSWORD: To restart your gateway core. Restore configs PASSWORD: To reset the configuration files back to the default factory settings. Get info PASSWORD: To get your gateway IP address
SMS inbox Auto clean	switch on: When the size of the SMS inbox record file reaches the max size, the system will cut a half of the file. New record will be retained. switch off: SMS record will remain, and the file size will increase gradually. default on, max size = 20 MB
SMS outbox Auto clean	switch on: When the size of the SMS outbox record file reaches the max size, the system will cut a half of the file. New record will be retained. switch off: SMS record will remain, and the file size will increase gradually. default on, max size = 20 MB

6.1.4 Phone Number Query

This feature is querying phone number of Internal type. You can set password here. When sending message (get phonenum password) to device, device will reply your phone number.

Figure 6-5 Phone Number Query

The screenshot shows the 'WirelessGateway' interface with a sidebar on the left containing 'SYSTEM', 'MODULE', 'VOIP', 'ROUTING', and 'SMS' categories. The 'SMS Settings' page is active, with sub-tabs for 'General', 'Sender Options', 'SMS to Email', 'SMS to Email--Destination Email Address', 'SMS Control', and 'Phone Number Query'. The 'Phone Number Query' settings are as follows:

- Enable:**
- Password:** 123456 (with a visibility icon)
- SMS Formats:** get phonenum password

6.1.5 Auto-reply

Edit text here, when sending SMS to device, it will reply SMS with text.

Figure 6-6 Auto-reply

The screenshot shows the 'WirelessGateway' interface with the 'Auto-reply' sub-tab selected. The settings are:

- Enable:**
- Send Text:** A text input field with an 'Add' button and a list of 13 items, each consisting of a 'Random' dropdown and an 'Ite-' label (Ite-1 through Ite-13).

6.1.7 HTTP to SMS

It support http API for sending SMS . You can call API in your program.

Figure 6-7 HTTP to SMS

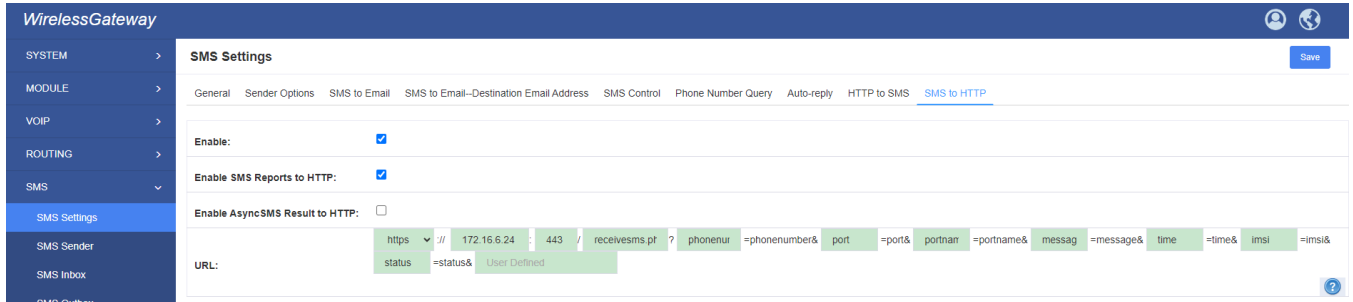

The screenshot shows the 'WirelessGateway' interface with the 'HTTP to SMS' sub-tab selected. The settings are:

- Enable:**
- Enable CORS:**
- URL:** http://172.16.6.247:80/sendsms?username=xxx&password=xxx&phonenum=xxx&message=xxx&[port=xxx&][report=xxx&][timeout=xxx&][id=xxx]
- User Name:** smsuser (with a 'Use default user and password' checkbox checked)
- Password:** (masked with dots and a visibility icon)
- Items:** Four items (Ite-1, Ite-2, Ite-3, Ite-4) are checked with

6.1.8 SMS to HTTP

It support http API for receiving SMS , it can push incoming SMS to your program.

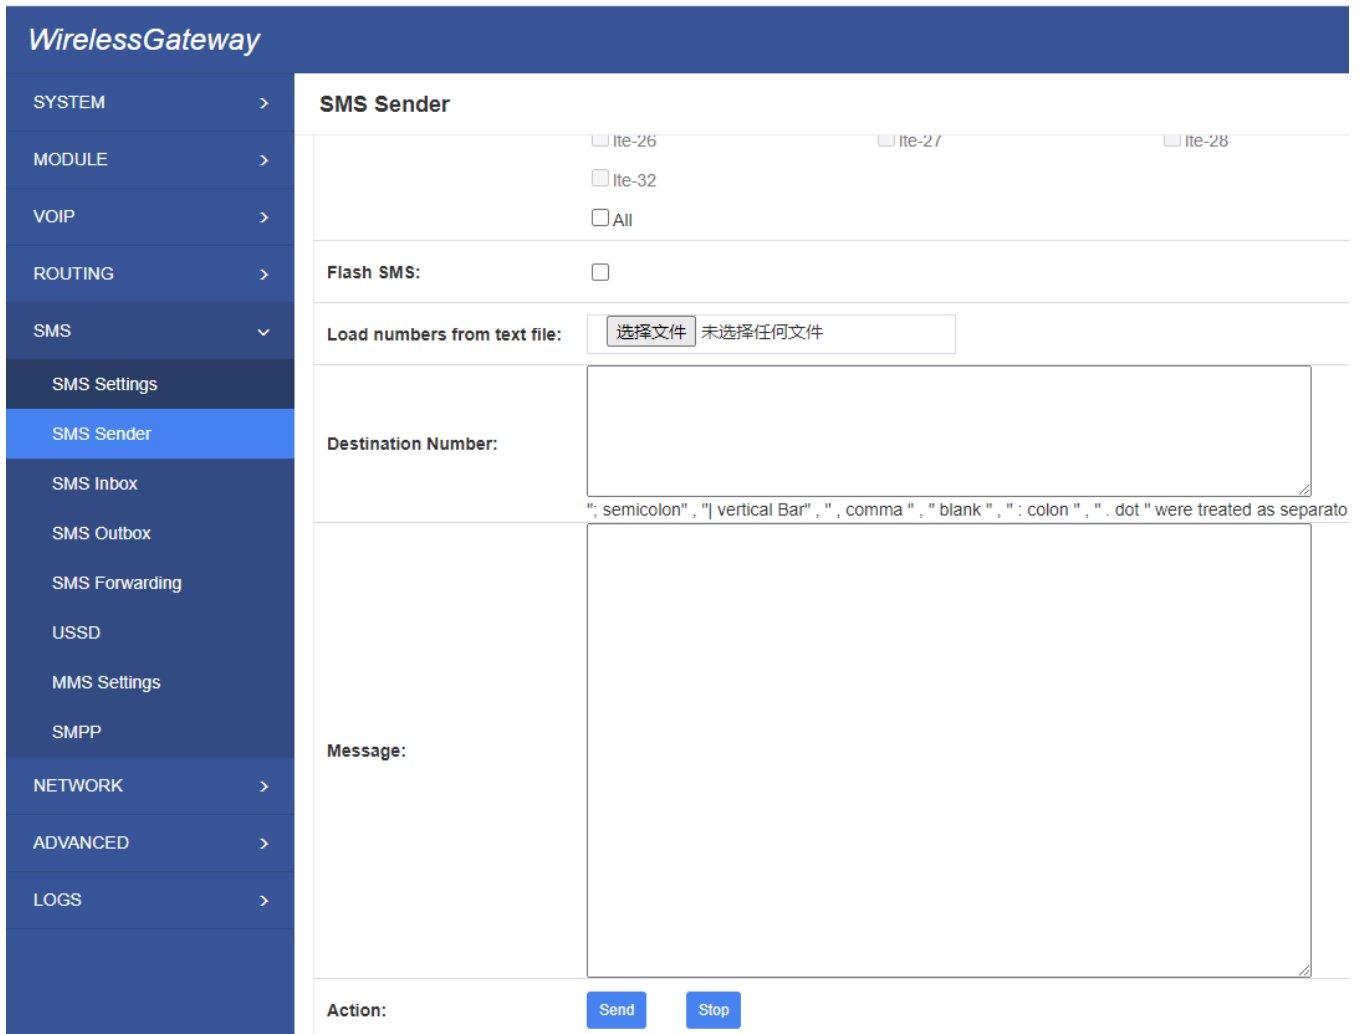

Figure 6-8 SMS to HTTP Settings

6.2 SMS Sender

You can choose one or more ports to send SMS to the destination number, different numbers should be separated by symbols: '\r', '\n', space character, semicolon and comma. Then you can see much feedback information.

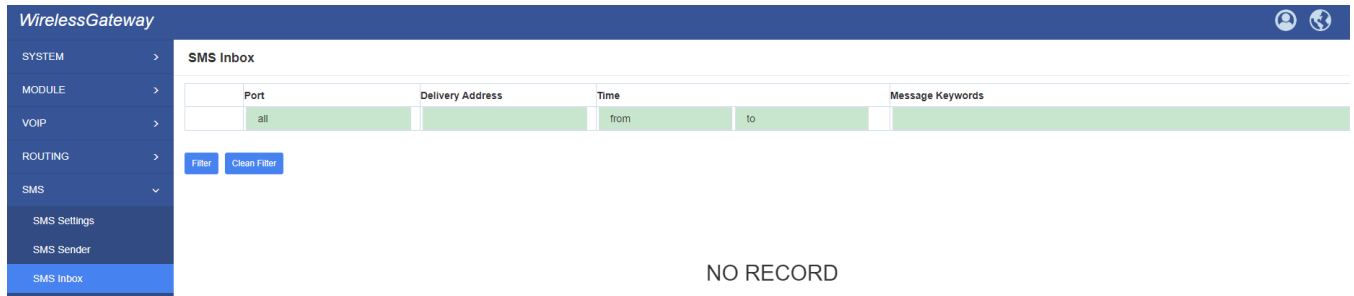

Figure 6-9 SMS Sender

6.3 SMS Inbox

On this page, you are allowed to scan, delete, clean up, and export each port's received SMS. Also you are allowed to check messages by port, phone number, time order and message keywords.

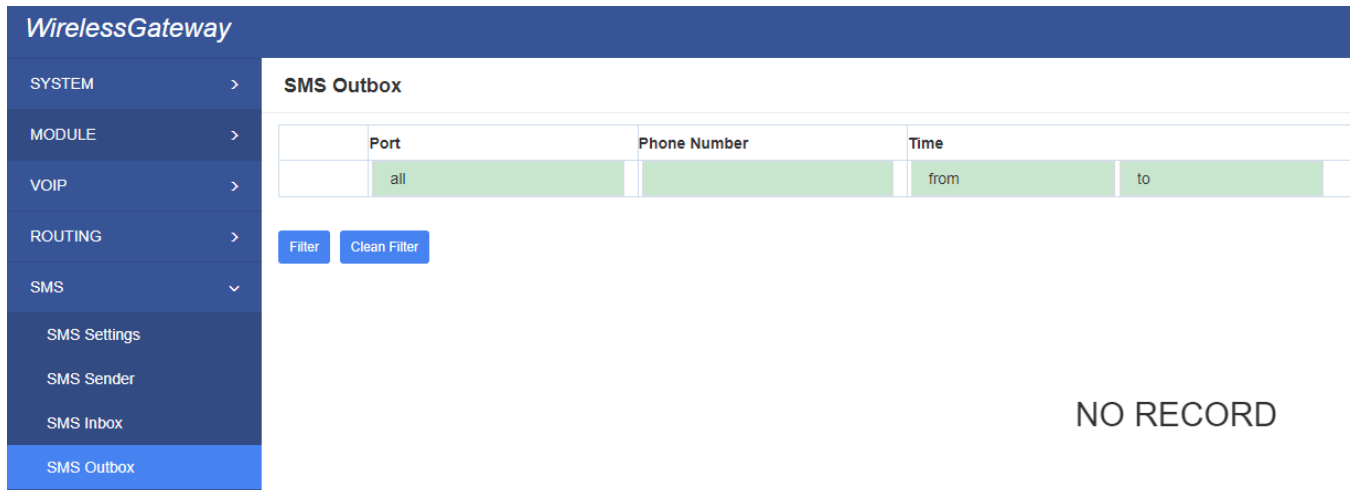

Figure 6-10 SMS Inbox

6.4 SMS Outbox

On this page, you are allowed to scan, delete, clean up, and export each port's received SMS. Also you are allowed to check messages by port, phone number, time order and message keywords.

Figure 6-11 SMS Outbox

6.5 SMS Forwarding

Using this feature, you can forward incoming sms to your mobile. You can click button to add new routing. Such as:

-------------------	---

7.3 DDNS Settings

You can enable or disable DDNS (dynamic domain name server).

Figure 7-4 DDNS Settings

Table7-4 Definition of DDNS Settings

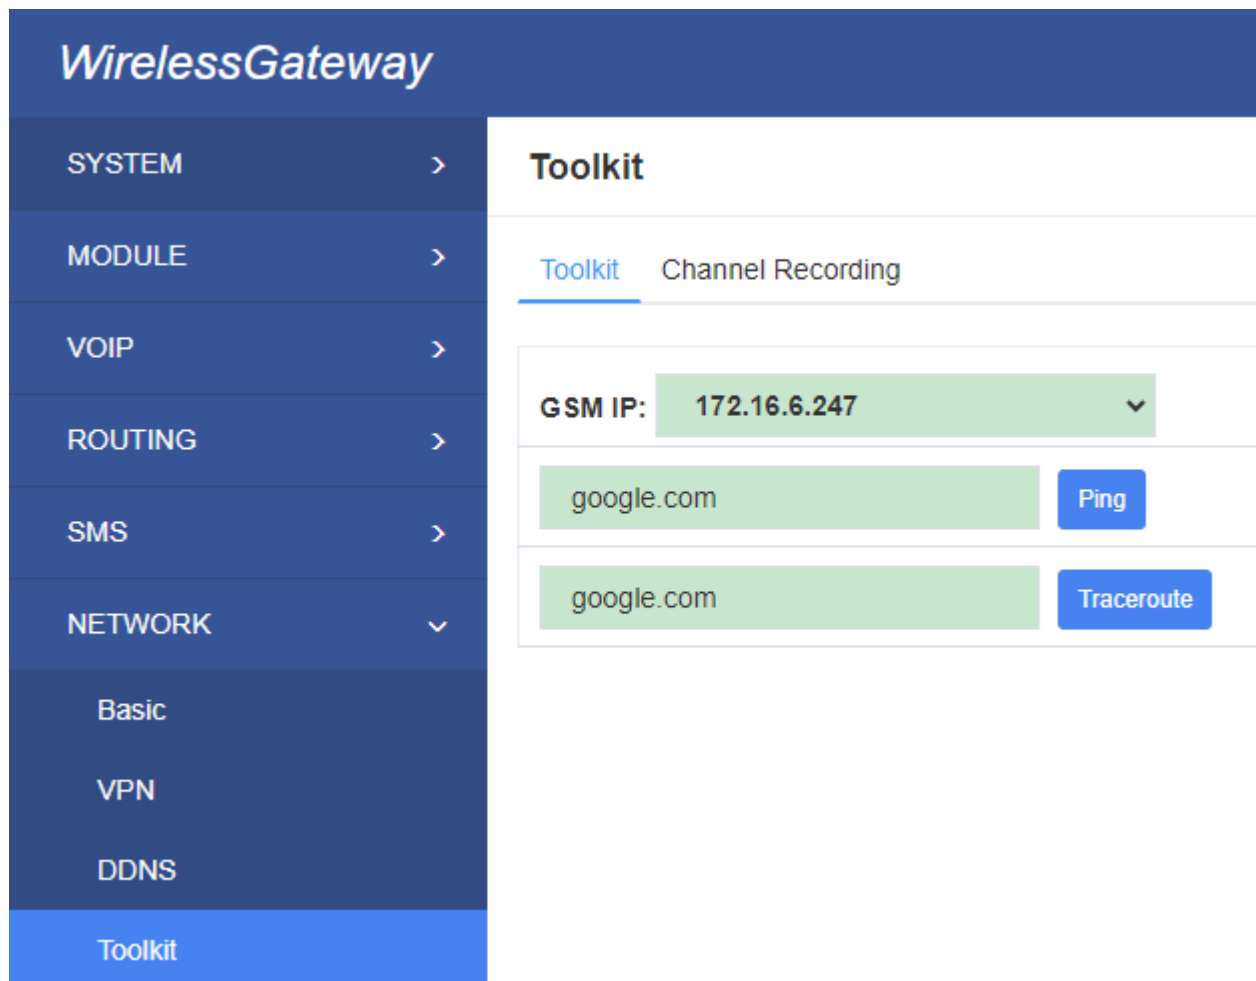

Options	Definition
DDNS	Enable/Disable DDNS(dynamic domain name server)
Type	Set the type of DDNS server.
Username	Your DDNS account's login name.
Password	Your DDNS account's password.
Your domain	The domain to which your web server will belong.

7.4 Toolkit

7.4.1 Ping and Traceroute

It is used to check network connectivity. Support Ping command on web GUI.

Figure 7-5 Toolkit

7.4.2 Channel Recording

You can capture the network packets on the page to facilitate problems.

Figure 7-6 Capture

7.5 Security Settings

7.5.1 Firewall Settings

Figure 7-7 Firewall Settings

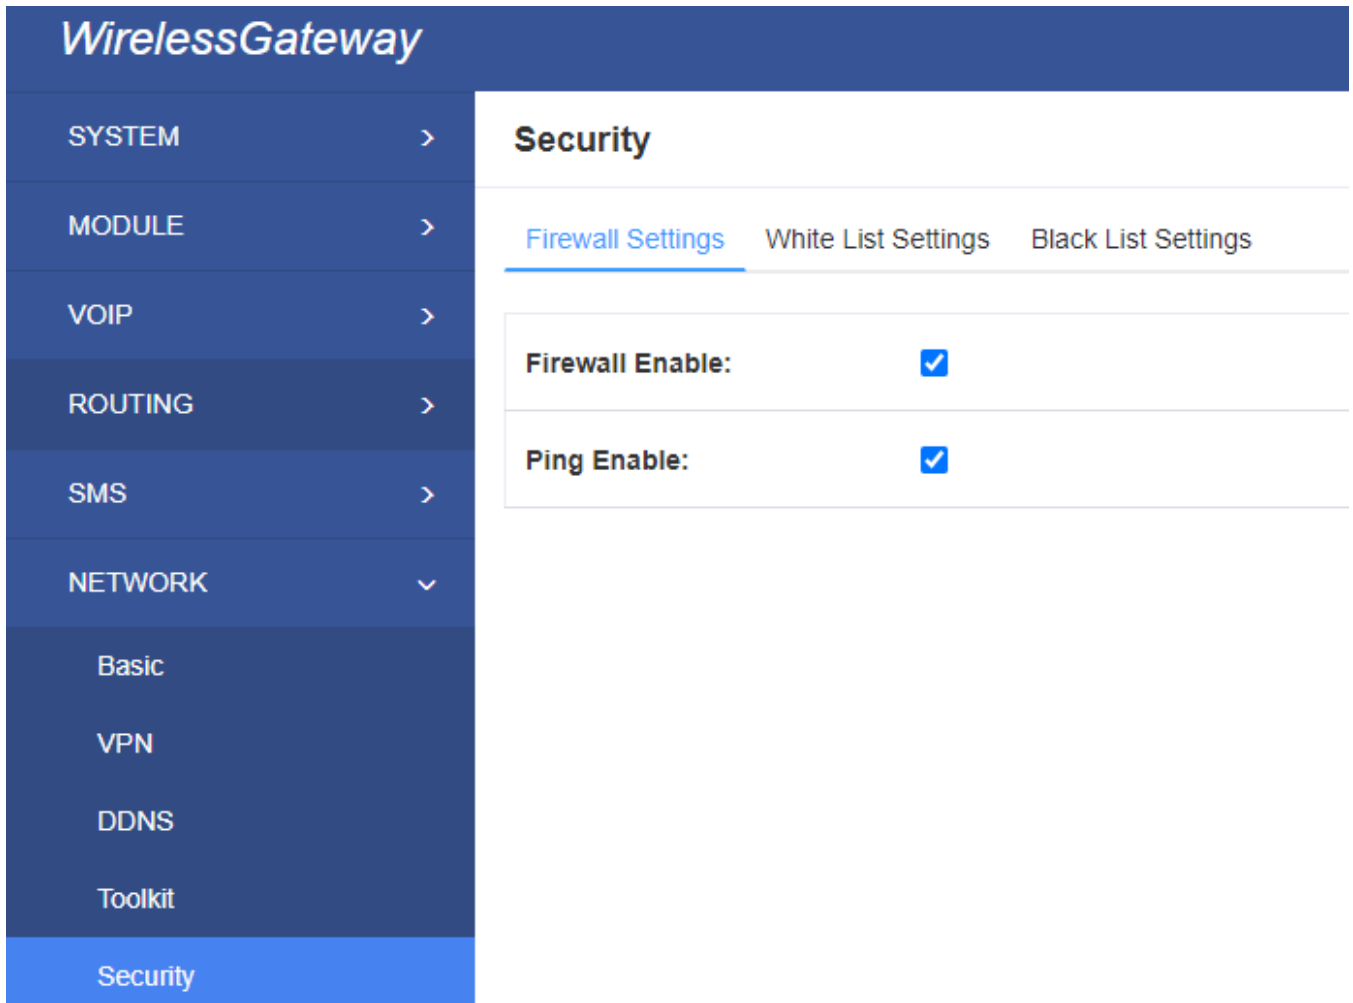

Table 7-6 Definition of Firewall Settings

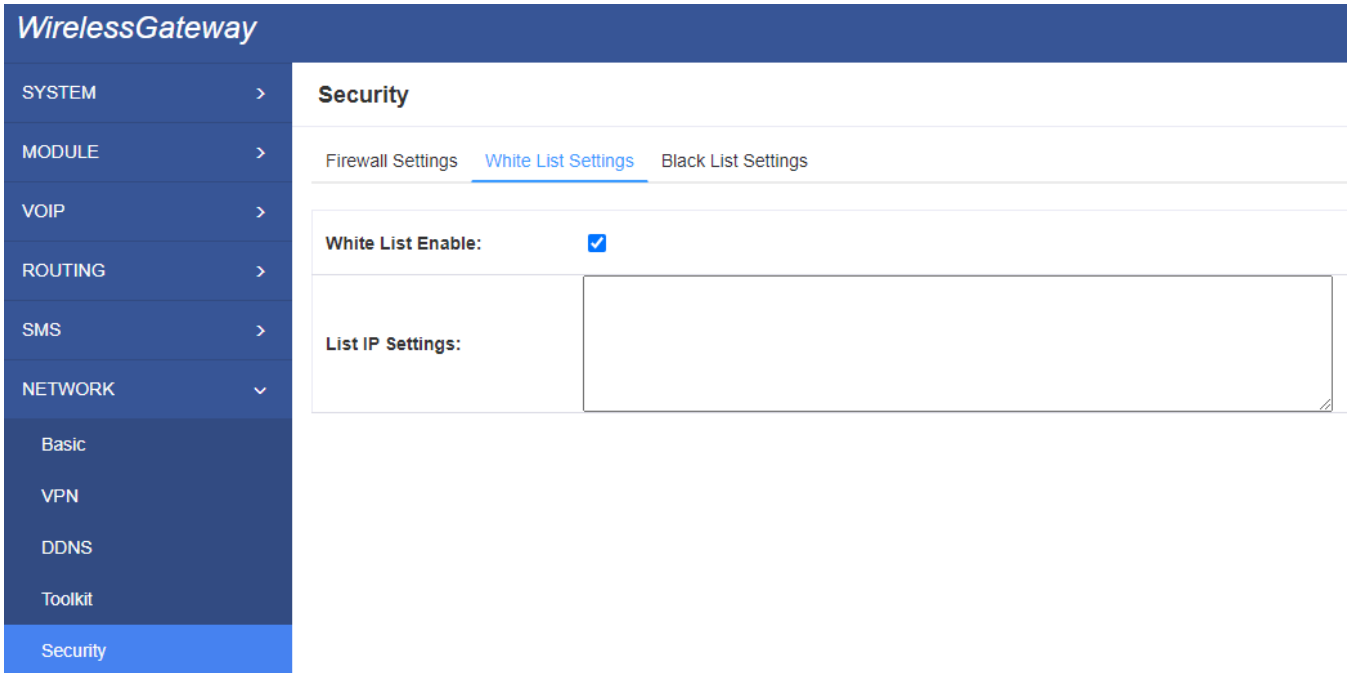

Options	Definition
Firewall Enable	If you want to use White/Black List, and security rules, you must enable this option.
Ping Enable	To disable ping or not. OFF: disable ping. This gateway will not allow to ping.

7.5.2 White/Black List Settings

White List Enable: To enable white list or not.

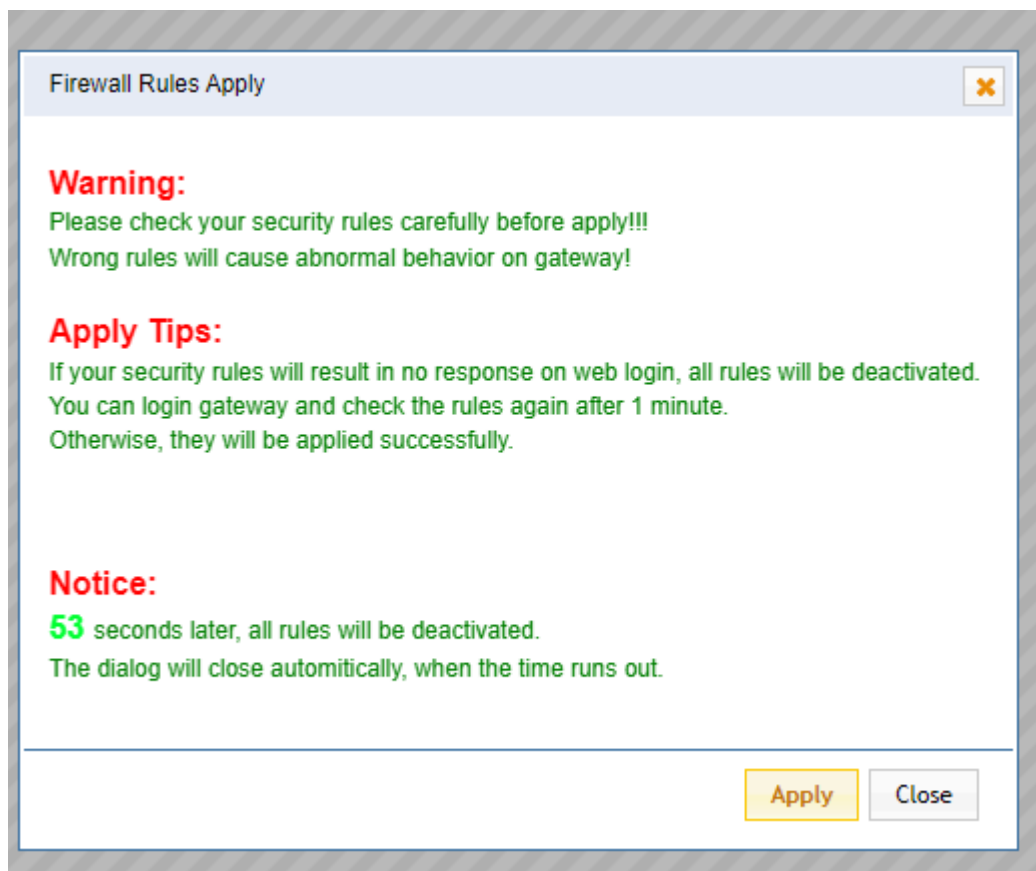

List IP Settings: IPs are separated only by "," character.

Figure 7-8 White/Black List Settings

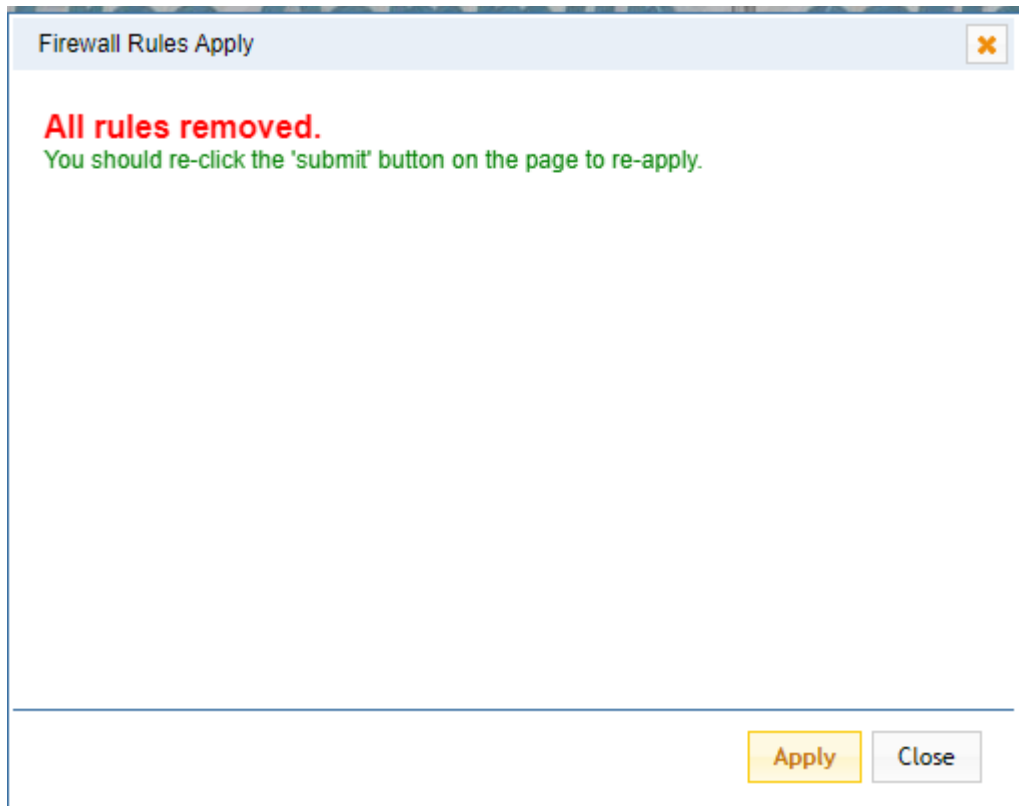

Click "Save" button to save configuration; Click "submit" button to submit and apply configuration. If "List IP Settings" has no problem, you will see popup window like below. Please read the warning and tips carefully. And Click "Apply" button in 1 minute. If time runs out, this window will close automatically.

Figure 7-9 Firewall Rules Apply

If you see windows like below. It means your configuration has been applied successfully.

Figure 7-10 Firewall Rules Apply

7.6 Security Rules

If "List IP Settings" has no problem, you will see popup window like below. Please read the warning and tips carefully. And Click "Apply" button in 1 minute. If time runs out, this window will close automatically.

7.7 SIP Capture

You can capture the SIP packets on the page to facilitate locationg problems.

Figure 7-14 SIP Capture

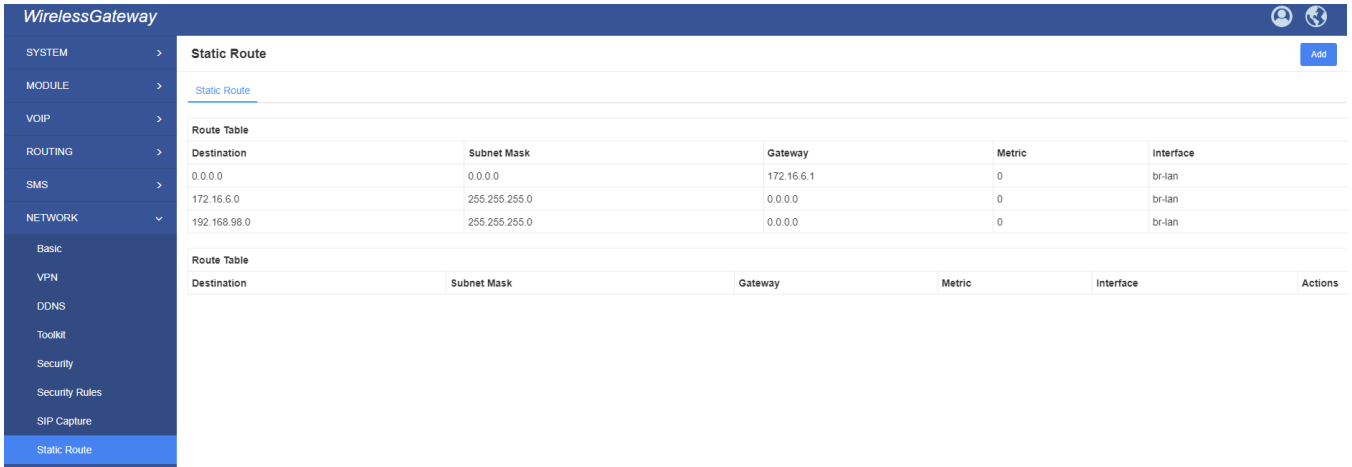

The screenshot shows the 'WirelessGateway' configuration interface. On the left is a dark blue sidebar with a navigation menu. The 'SIP Capture' option is highlighted in a lighter blue. The main content area is white and titled 'SIP Capture'. It features a dropdown menu for 'Interface:' set to 'br-lan'. Below that, the 'Method-filter:' section has four checkboxes: 'INVITE' (checked), 'OPTIONS', 'REGISTER', and 'All'.

Table 7-7 SIP Capture Settings

Options	Definition
Interface	You can choose eth0 or eth1
Method-filter	You can choose INVITE, OPTIONS and REGISTER

7.8 Static Route

Figure 7-15 Static Route

8. Advances

8.1 Asterisk API

When you make "Enable" switch to "ON", this page is available.

Figure 8-1 Asterisk API

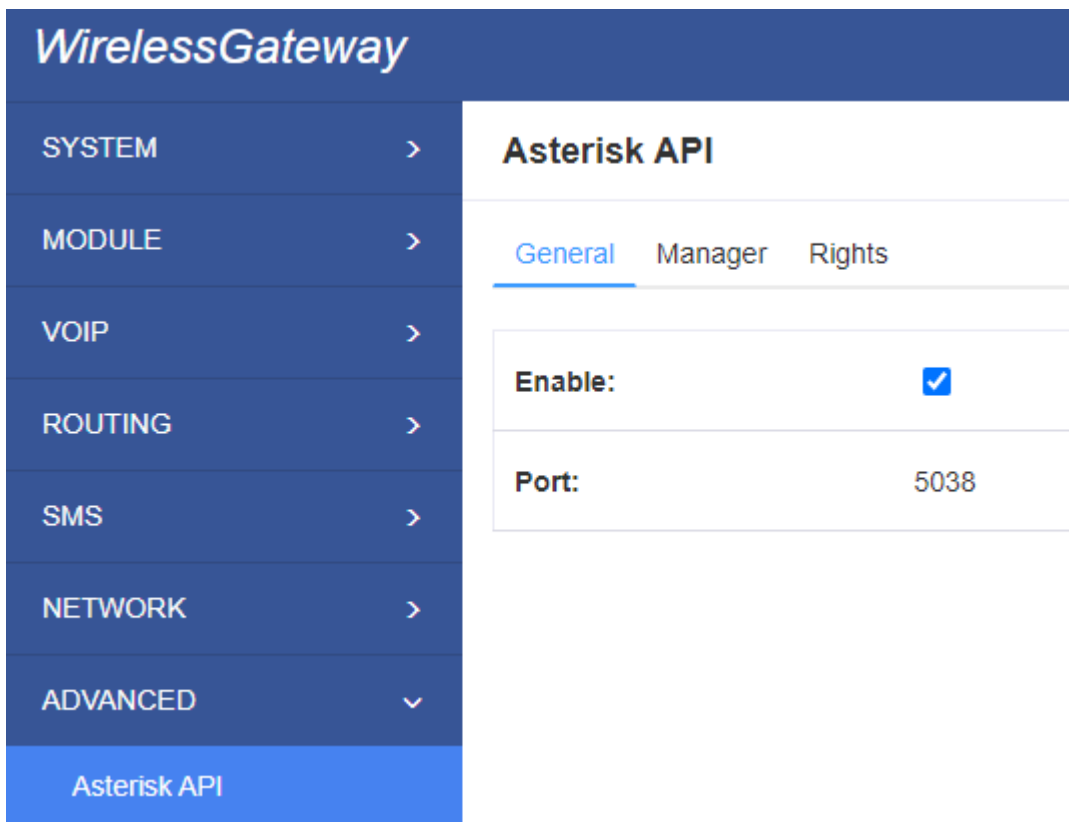

Table 8-1 Definition of Asterisk API

Options	Definition
Port	Network port number
Manager Name	Name of the manager without space

Manager secret	Password for the manager. Characters: Allowed characters "-_+.<>&0-9a-zA-Z". Length:4-32 characters.
Deny	If you want to deny many hosts or networks, use char & as separator.Example: 0.0.0.0/0.0.0.0 or 192.168.1.0/255.255.255.0&10.0.0.0/255.0.0.0
Permit	If you want to permit many hosts or network, use char & as separator. Example: 0.0.0.0/0.0.0.0 or 192.168.1.0/255.255.255.0&10.0.0.0/255.0.0.0
System	General information about the system and ability to run system management commands, such as Shutdown, Restart, and Reload.
Call	Information about channels and ability to set information in a running channel.
Log	Logging information. Read-only. (Defined but not yet used.)
Verbose	Verbose information. Read-only. (Defined but not yet used.)
Command	Permission to run CLI commands. Write-only.
Agent	Information about queues and agents and ability to add queue members to a queue.
User	Permission to send and receive UserEvent.
Config	Ability to read and write configuration files.
DTMF	Receive DTMF events. Read-only.
Reporting	Ability to get information about the system. CDR Output of cdr, manager, if loaded.
CDR	Call records. Read-only.
Dialplan	Receive NewExten and Varset events. Read-only.
Originate	Permission to originate new calls. Write-only.
All	Select all or deselect all.

Once you set like the above figure, the host 172.16.100.110/255.255.0.0 is allowed to access the gateway API. Please refer to the following figure to access the gateway API by telnet. 172.16.179.1 is the gateway's IP, and 5038 is its API port.

Figure 8-2 Telnet Access Gateway API

8.2 Asterisk CLI

In this page, you are allowed to run Asterisk commands.

Figure 8-3 Asterisk CLI

Command:Type your Asterisk CLI commands here to check or debug your gateway.

Notice: If you type "help" or "?" and execute it, the page will show you the executable commands.

8.3 Asterisk File Editor

On this page, you are allowed to edit and create configuration files. Click the file to edit.

Figure 8-4 Asterisk File Editor

Click "New Configuration File" to create a new configuration file. After editing or creating, please reload Asterisk.

8.3 Internet

Edit APN and URL here. Then device will access URL through internet.

Figure 8-5 Internet

ID	Mobile Number	Open	APN User Name	APN Password	APN	URL	MAX(MB)	USED	Time	Save
<input type="checkbox"/>		No								
<input type="checkbox"/>	lte-1	No								
<input type="checkbox"/>	lte-2	No								
<input type="checkbox"/>	lte-3	No								
<input type="checkbox"/>	lte-4	No								
<input type="checkbox"/>	lte-6	No								
<input type="checkbox"/>	lte-7	No								
<input type="checkbox"/>	lte-8	No								

8.4 Cloud Management

Gateways support OpenVox Cloud Management.

Figure 8-6 Cloud Management

Cloud

Enable Cloud Service:

Interface:

Choose Service:

Account:

* Password:

Don't have an account? [Sign up](#)

If your device is connected to the cloud management, the SSH and web pages of the gateway can be accessed through the cloud management, and it can be monitored whether the device is connected to the cloud management platform. On the cloud management platform, you can also count your device model, quantity, distribution area, and so on.

Table 8-2 Definition of Cloud Management

Options	Definition
Enable Cloud Service	Turn on/off cloud management
Choose Service	Currently supports two servers, one is China and the other is the United States.
Account	Registered account or email on the cloud management platform
Password	The password of the account registered on the cloud management platform
Connection Status	Is it currently connected to the cloud management platform?

8.5 Balance

We offer three way to query balance: SMS, USSD, Tel.

Note: This feature should be supported by operator firstly.

Figure 8-7 Balance

Group Configuration(v3)

Group	User
notConfigGroup2	username1

9. Logs

On the "Log Settings" page, you should set the related logs on to scan the responding logs page. For example, set "System Logs" on like the following, then you can turn to "System" page for system logs, otherwise, system logs is unavailable. And the same with other log pages.

Figure 9-1 Log Settings

You can scan your CDR easily on web GUI, and also you can delete, clean up or export your CDR information.

Figure 9-2 CDR Output

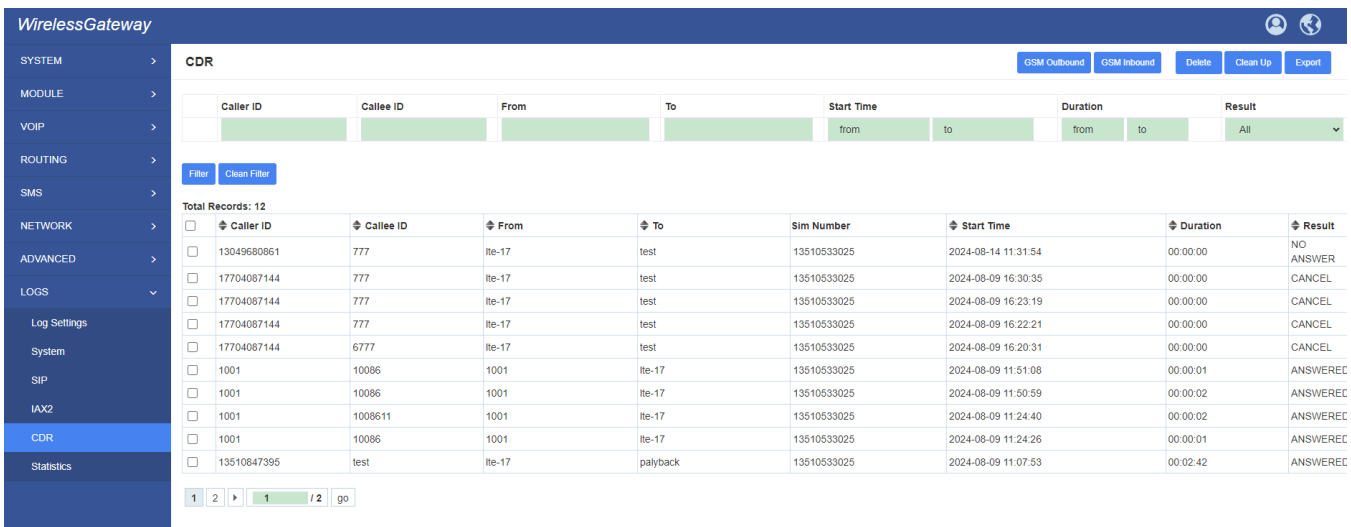

Table9-1 definition of Logs

Options	Definition
System Logs	Whether enable or disable system log.
Auto clean (System Logs)	switch on : when the size of log file reaches the max size, the system will cut a half of the file. New logs will be retained; switch off : logs will remain, and the file size will increase gradually. default on, maxsize=1M.
SIP Logs	Whether enable or disable SIP log.

Auto clean (SIP logs)	switch on: when the size of log file reaches the max size, the system will cut a half of the file. New logs will be retained. switch off: logs will remain, and the file size will increase gradually. default on, maxsize=100KB.
IAX Logs	Whether enable or disable IAX log.
Auto clean(IAX logs)	switch on: when the size of log file reaches the max size, the system will cut a half of the file. New logs will be retained. switch off: logs will remain, and the file size will increase gradually. default on, maxsize=100KB.
Call Detail Record	Displaying Call Detail Records for each channel.
Auto clean (CDR logs)	switch on : when the size of log file reaches the max size, the system will cut a half of the file. New logs will be retained. switch off : logs will remain, and the file size will increase gradually. default on, max size=20MB.
Syslog	Configure it, logs will be sent to your syslog server.

Appendix Feature List

VOIP Characters

- Support SIP, IAX2 Protocol
- Add, Modify & Delete SIP/IAX2 Trunk
- SIP/IAX2 Registration with Domain
- Combine Different SIP/IAX2 Trunk into Group
- DTMF Mode: RFC2833/Inband/SIPInfo
- SIP V2.0 RFC3261 Compliance
- Multiple SIP/IAX2 Registrations modes:

None (No registration, just IP and Password authentication)

Endpoint registers with this gateway (work as a SIP Sever)

This gateway registers with the endpoint (work as a SIP/IAX2 client)

Network

- IPv4, UDP/TCP, DHCP, TELNET, HTTP/HTTPS, TFTP
- PPTP VPN
- HTTP/SSH (Optical Telnet)
- Ping & Traceroute Command on the Web
- Simple Security Strategy: white list, black list, security rules

System Features

- Combine Different SIP/IAX2 Trunk into Group
- CLID Display & Hide (Need operators' support)
- Random call interval
- Call Duration Limitation
- Single Call Duration Limitation
- Real Open API Protocol (based on Asterisk)
- Support DISA
- SMSC/SMS/USSD
- PIN Identification
- Optional Voice Codec
- Ports Group Management
- SMS Bulk Transceiver, Sent to Email and Automatically Resend
- SMS Coding/Detecting Automatically Identification
- SMS Remotely Controlling Gateway
- SMS Forwarding and Quick Reply
- USSD transceiver
- Outbound
- Automatically Reboot
- Support MMP
- Support for custom scripts, dialplans
- Support Openvox cloud manage

Management

- Simple and convenient configuration via Web GUI
- Support maintenance and configuration by SSH
- Support configuration files backup and upload
- Support Chinese and English page
- Firmware Update by HTTP
- Support Web and SSH login password modification
- Restore Factory Settings
- CDR(More than 200,000 Lines CDRs Storage Locally)
- System log
- SIP/IAX2 log
- TCP and SIP capture
